

Ultra-Small, 330nA and 1μA Single Supply, Rail-to-Rail Input/Output (RRIO) Op Amps

The ISL28194 is micropower op amps optimized for low-power applications. The part is designed for single-supply operation from 1.8V to 5.5V, making it suitable for applications with two 1.5V alkaline batteries. The ISL28194 consumes typically 330nA of supply current. The part features rail-to-rail input and output swing (RRIO), allowing for maximum battery usage.

Equipped with a shutdown pin, the part draws typically 2nA when off. The combination of small footprint, low power, single supply, and rail-to-rail operation makes it ideally suited for all battery-operated device.

Pinouts

Features

- Typical Supply Current 330nA
- Ultra-Low Single-Supply Operation Down to +1.8V
- Rail-to-Rail Input/Output Voltage Range (RRIO)
- Maximum 2mV Offset Voltage
- Maximum 60pA Input Bias Current
- 3.5kHz Gain Bandwidth Product
- ENABLE Pin Feature
- -40°C to +125°C Operation
- Pb-Free (RoHS Compliant)

Applications

- 2-Cell Alkaline Battery-Powered/Portable Systems
- Window Comparators
- Threshold Detectors/Discriminators
- Mobile Communications
- Low Power Sensors

Ordering Information

NOTES:

1. Please refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and NiPdAu plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
4. The part marking is located on the bottom of the part.

Absolute Maximum Ratings ($T_A = +25^\circ\text{C}$)

Supply Voltage (V_+ , V_-)	5.75V
Supply Turn On Voltage Slew Rate	1V/ μs
Differential Input Current	5mA
Differential Input Voltage	$V_- - 0.5\text{V}$ to $V_+ + 0.5\text{V}$
ESD Rating	
Human Body Model	3kV
Machine Model	300V

Thermal Information

Thermal Resistance (Typical, Note 5)	θ_{JA} ($^\circ\text{C/W}$)
6 Ld SOT-23	230
6 Ld UTDFN	118
Output Short-Circuit Duration	Indefinite
Ambient Operating Temperature Range	-40°C to $+125^\circ\text{C}$
Storage Temperature Range	-65°C to $+150^\circ\text{C}$
Operating Junction Temperature	$+125^\circ\text{C}$
Pb-Free Reflow Profile	see link below
http://www.intersil.com/pbfree/Pb-FreeReflow.asp	

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTE:

5. θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief [TB379](#) for details.

IMPORTANT NOTE: All parameters having Min/Max specifications are guaranteed. Typical values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore: $T_J = T_C = T_A$

Electrical Specifications $V_+ = 5\text{V}$, $V_- = 0\text{V}$, $V_{CM} = 2.5\text{V}$, $T_A = +25^\circ\text{C}$, Unless Otherwise Specified.
Boldface limits apply over -40°C to $+125^\circ\text{C}$.

PARAMETER	DESCRIPTION	CONDITIONS	MIN (Note 6)	TYP	MAX (Note 6)	UNIT

Applications Information

Introduction

The ISL28194 is a CMOS rail-to-rail input and output (RRIO) micropower operational amplifier. This device is designed to operate from single supply (1.8V to 5.5V) and has an input common mode range that extends to the positive rail and to the negative supply rail for true rail-to-rail performance. The CMOS output can swing within tens of millivolts to the rails. Featuring worst-case maximum supply current of 0.5μA, this amplifier is ideally suited for solar and battery-powered applications.

Input Protection

All input terminals have internal ESD protection diodes to both positive and negative supply rails, limiting the input voltage to within one diode beyond the supply rails. The ISL28194 has a maximum input differential voltage that includes the rails (-V -0.5V to +V +0.5V).

Rail-to-Rail Output

A pair of complementary MOSFET devices are used to achieve the rail-to-rail output swing. The NMOS sinks current to swing the output in the negative direction. The PMOS sources current to swing the output in the positive direction. The ISL28194 will typically swing to within 40mV or less to either rail with a 100kΩ load (reference Figures 24 and 26).

Enable/Disable Feature

This part offers an EN pin that enables the device when pulled high. The enable threshold is referenced to the -V terminal and has a level proportional to the total supply voltage (reference Figure 11 for EN threshold vs supply voltage). The enable circuit has a delay time that changes as a function of supply voltage. Figures 12 and 13 show the effect of supply voltage on the enable and disable times. For supply voltages less than 3V, it is recommended that the user account for the increase enable/disable delay time.

In the disabled state (output in a high impedance state), the supply current is reduced to typical of only 2nA. By disabling the devices, multiple parts can be connected together as a MUX. In this configuration, the outputs are tied together in parallel and a channel can be selected by the EN pin. The EN pin should never be left floating. The EN pin should be connected directly to the V+ supply when not in use.

The loading effects of the feedback resistors of the disabled amplifier must be considered when multiple amplifier outputs are connected together.

Proper Layout Maximizes Performance

To achieve the maximum performance of the high input impedance, care should be taken in the circuit board layout. The PC board surface must remain clean and free of moisture to avoid leakage currents between adjacent traces. Surface coating of the circuit board will reduce surface moisture and provide a humidity barrier, reducing parasitic resistance on the board. When input leakage current is a concern, the use of guard rings around the amplifier inputs will further reduce leakage currents. Figure 30 shows a guard ring example for a unity gain amplifier that uses the low impedance amplifier output at the same voltage as the high impedance input to eliminate surface leakage. The guard ring does not need to be a specific width, but it should form a continuous loop around both inputs. For further reduction of leakage currents, components can be mounted to the PC board using Teflon standoff insulators.

FIGURE 30. GUARD RING EXAMPLE FOR UNITY GAIN AMPLIFIER

Power Dissipation

It is possible to exceed the +150°C maximum junction temperatures under certain load and power-supply conditions. It is therefore important to calculate the maximum junction temperature (T_{JMAX}) for all applications to determine if power supply voltages, load conditions, or package type need to be modified to remain in the safe operating area. These parameters are related in Equation 1:

$$T_{JMAX} = T_{MAX} + (\theta_{JA} \times PD_{MAXTOTAL}) \quad (EQ. 1)$$

where:

- $PD_{MAXTOTAL}$ is the sum of the maximum power dissipation of each amplifier in the package (PD_{MAX})
- PD_{MAX} for each amplifier can be calculated as shown in Equation 2:

$$PD_{MAX} = 2 \times V_S \times I_{SMAX} + (V_S - V_{OUTMAX}) \times \frac{V_{OUTMAX}}{R_L} \quad (EQ. 2)$$

where:

- T_{MAX} = Maximum ambient temperature
- θ_{JA} = Thermal resistance of the package
- PD_{MAX} = Maximum power dissipation of 1 amplifier
- V_S = Supply voltage (Magnitude of V_+ and V_-)
- I_{MAX} = Maximum supply current of 1 amplifier
- V_{OUTMAX} = Maximum output voltage swing of the application
- R_L = Load resistance
