

TDA7432

BASIC FUNCTION AUDIO PROCESSOR

- ONE STEREO AND ONE MONO INPUTS
- MUTE FUNCTION (SOFTWARE AND HARDWARE) CONTROLLED
- VOLUME CONTROL IN 1dB STEP
- BASS AND TREBLE CONTROL IN 2dB STEP
- FULLY PROGRAMMABLE LOUDNESS CONTROL
- FOUR SPEAKER ATTENUATORS:
 - Independent attenuation control
 - Independent mute function
- ALL FUNCTIONS PROGRAMMABLE VIA I²C BUS

DESCRIPTION

The TDA7432 is a volume, tone (bass and treble) balance (Left/Right) processor for quality audio applications in car radio and Hi-Fi systems.

Control is accomplished by serial bus microprocessor interface.

The AC signal setting is obtained by resistor net-

works and switches combined with operational amplifiers.

Thanks to the advanced BIPOLAR/CMOS Technology, the external components have been reduced.

SOFTWARE SPECIFICATION**Interface Protocol**

The interface protocol comprises:

- a start condition (S)
- a chip address byte (the LSB bit determines read / write transmission)
- a subaddress byte
- a sequence of data (N-bytes + acknowledge)
- a stop condition (P)

ACK = Acknowledge

S = Start

P = Stop

MAX CLOCK SPEED 500kb/s

Auto Increment

If bit I in the subaddress byte is set to "1", the autoincrement of the subaddress is enabled.

SUBADDRESS (receive mode)

Note 2:

It is not recommended to use a gain more than 20dB for system performance reason. In general, the max. gain should be limited by software to the maximum value, which is needed for the system.

For example to select -14dB Loudness the Data Byte is : X X X 0 1 1 1 0.

Note3:

Fiat attenuation, according to the selected byte. The loudness can be completely disabled by setting bit D7 in the volume byte to "0". In this case the attenuation is 0dB independent from the loudness settings.

Functional Description

The input selector is able to select 1 stereo inputs and 1 mono input (AM). The inputs are DC biased with 100kΩ resistors to the internal reference voltage of 3V. The AM input can be use additionally as hardware mute pin. If this pin is pulled to ground by an external transistor and AM is not selected, the input selector mutes the input (reference voltage selected). The AM part is considered to be switched OFF. If the output of the AM part is not high ohmic in this condition, a series resistor of about 20kΩ has to be foreseen.

The volume control can be programmed from a gain of +32dB to an attenuation of -79dB in 1dB steps. The maximum gain should be kept as low as possible for system performance reason. It has to be limited by software to the absolute necessary system gain, depending on the signal source level and the power amplifier gain.

The bass control acts in a range from +18dB to -18dB in 2dB steps. The filter response is deter-

mined by the external filter components. An extensive simulation software is available in order to support the design of the bass filter response with different filter configurations.

The extended bass boost range of +18dB allows the implementation of the software loudness function by additional bass and treble boost.

The treble control acts in a range of ±14dB in 2dB steps. The external capacitor determines with the internal resistor of 50kΩ the corner frequency of the treble response.

The four speaker attenuators can be controlled independently from 0 to -37.5dB, which allows the implementation of balance and fader a the four speaker system. The attenuation steps size is 1 db from 0 to -24dB and increases nonlinearly up to the maximum attenuation of 37.5dB. A special mute bit forces the speaker attenuator into the mute position.

All 4 outputs are low distortion push pull outputs, able to drive a load of 3kΩ.
