3. Interface signals

Table 2(a): Pin Assignment of CN1

Pin No.	Symbol	Description
1	RES	When RES is set to Low, the settings are initialized. The reset operation is performed by the RES signal level.
2	CSA	This is the chip select signal for first chip. When CSA(CS1)="Low" and CS2=HIGH, then the chip select becomes active and the input/output of data/commands is enabled.
3	CSB	This is the chip select signal for second chip. When CSB(CS1)="Low" and CS2=HIGH, then the chip select becomes active and the input/output of data/commands is enabled.
4	A0	This is connect to the least significant bit of the normal MPU address bus, and it determines whether the data bits are data or a command. A0="High": Indicates that SCL, and SI are display data. A0="Low": Indicates that SCL and SI are control data.
5	SCL	Serial clock input terminal.
6	SI	Serial data input terminal.
7	VDD	Power supply for logic(+3V).
8	VSS	0 V pin connected to the system ground (GND).
9	VOUT	DC/DC voltage converter. Connects a capacitor between this terminal and VSS.
10	CAP3-	DC/DC voltage converter. Connects a capacitor between this terminal and CAP1+ pin.
11	CAP1+	DC/DC voltage converter. Connects a capacitor between this terminal and CAP1- pin.
12	CAP1-	DC/DC voltage converter. Connects a capacitor between this terminal and CAP1+ pin.
13	CAP2-	DC/DC voltage converter. Connects a capacitor between this terminal and CAP2+ pin.
14	CAP2+	DC/DC voltage converter. Connects a capacitor between this terminal and CAP2- pin.
15	V1	This is multi-level power supply for liquid crystal drive. The voltage applied is determined by the liquid crystal cell, and is changed through the use of a resistive voltage divided or through changing the impedance using an op. amp. Voltage levels are determined based on VDD, and must maintain the relative magnitudes shown below. $VDD (=V0) \geq V1 \geq V2 \geq V3 \geq V4 \geq V5$ Master operation When the power supply turns ON, the internal power supply circuits produce V1 to V4 voltages shown below. The voltage setting are selected using the LCD bias set command. For 1/7 bias: $V1=(1/7) \times V5$, $V2=(2/7) \times V5$, $V3=(5/7) \times V5$, $V4=(6/7) \times V5$.
16	V2	
17	V3	
18	V4	
19	V5	

Table 2(b): Pin Assignment of CN1

Pin No.	Symbol	Description
20	VR	Output voltage regulator terminal. Provides the voltage between VDD and V5 through a resistive voltage divider. These are only enabled when the V5 voltage regulator internal resistors are not used (IRS=LOW). These cannot be used when the V5 voltage regulator resistors are used (IRS=HIGH).
21	IRS	This terminal selects the resistors for the V5 voltage level adjustment. IRS=HIGH: Use the internal resistors. IRS=LOW: Do not use the internal resistors. The V5 voltage level is regulated by an external resistive voltage divider attached to the VR terminal. This pin is enabled only when the master operation mode is selected. It is fixed to either HIGH or LOW when the slave operation mode is selected.
22	NC	No connection.

Table 2(c): Pin Assignment of CN2

Pin No.	Symbol	Description
1	ANODE (+)	Anode of backlight
2	RED (-)	Cathode of backlight
3	GREEN (-)	Cathode of backlight
4	BLUE (-)	Cathode of backlight
