Description

Alpha's two-stage balanced K band GaAs MMIC power amplifier has a typical $P_{1\text{ dB}}$ of 22 dBm with 13 dB associated gain guaranteed across frequency range 21–23 GHz. The chip uses Alpha's proven 0.25 μm MESFET technology, and is based upon MBE layers and electron beam lithography for the highest uniformity and repeatability. The FETs employ surface passivation to ensure a rugged reliable part with through-substrate via holes and gold-based backside metallization to facilitate a conductive epoxy die attach process. All chips are screened for small signal S-parameters and power characteristics prior to shipment for guaranteed performance.

Bias Arrangement

For biasing on, adjust V_{DS} from zero to the desired value (6 V recommended). For biasing off, reverse the biasing on procedure.
