Data Sheet | June 13, 2013 | FN8093.4

5 Ld Voltage Supervisors with Adjustable Power-On Reset, Dual Voltage Monitoring or Watchdog Timer Capability

The ISL88011, ISL88012, ISL88013, ISL88014, ISL88015 family of devices offer both fixed and/or adjustable voltage-monitoring that combine popular functions such as Power-On reset control, watchdog timer, supply voltage supervision, and manual reset assertion in a small 5 Ld SOT-23 package.

Unique features on the ISL88013 and ISL88015 include a watchdog timer with a 51s start-up timeout and a 1.6s normal timeout duration. On the ISL88011 and ISL88014, users can increase the nominal 200ms Power-On reset timeout delay by adding an external capacitor to the C_{POR} pin. Both fixed and adjustable voltage monitors are provided by the ISL88012. Complementary active-low and active-high reset outputs are available on the ISL88011, ISL88012 and ISL88013 devices. All devices provide manual reset capability (see “Product Features Table” on page 5).

Seven preprogrammed reset threshold voltages accurate to ±1.5% over temperature are offered (see “Ordering Information” on page 3). The ISL88012, ISL88014 and ISL88015 have a user-adjustable voltage input available for custom monitoring of any voltage down to 0.6V. All parts are specifically designed for low power consumption and high threshold accuracy.

Features

- Single/dual voltage monitoring supervisors
- Fixed-voltage options allow precise monitoring of +2.5V, +3.0V, +3.3V, and +5.0V power supplies
- Dual supervisor has one fixed voltage input and another that is user-adjustable down to 0.6V.
- Both RST and $\overline{RST}$ outputs available
- Adjustable POR timeout delay options
- Watchdog timer with 1.6s normal and 51s start-up timeout durations
- Manual reset input on all devices
- Reset signal valid down to V_{DD} = 1V
- Accurate ±1.5% voltage threshold
- Immune to power-supply transients
- Ultra low 5.5µA supply current
- Small 5 Ld SOT-23 Pb-Free package
- Pb-Free (RoHS Compliant)

Applications

- Process control systems
- Intelligent instruments
- Embedded control systems
- Computer systems
- Critical µP and µC power monitoring
- Portable/battery-powered equipment
- PDA and handheld PC devices

NOTES:

1. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
2. The voltage trip point can be adjusted to be greater than 0.6V using 2 external resistors. By default, the VTHVMON trip point is 0.6V if no external resistors are used.
3. For Moisture Sensitivity Level (MSL), please see device information page for ISL88011, ISL88012, ISL88013, ISL88014, ISL88015. For more information on MSL please see techbrief TB363.
4. The part marking is located on the bottom of the part.

NOTES:

6. Applies to ISL88012.
7. Applies to ISL88014 and ISL88015.
8. Applies to ISL88013 and ISL88015.

Pin Description

RST

The push-pull RST output is set to V_{DD} (HIGH) listed in the following:

1. The device is first powered up.
2. Either V_{DD} or the voltage on VMON falls below their respective minimum voltage sense levels.
3. $\overline{MR}$ is asserted.
4. The watchdog timeout expires.

$\overline{RST}$/$\overline{MR}$

This pin functions as both a reset output and a manual reset input. The $\overline{RST}$ output functions identically to the complementary RST output but is an open drain output that is pulled to GND (LOW) when reset is asserted. The $\overline{MR}$ input is an active-low debounced input to which a user can connect a push-button to add manual reset capability or drive with active low signal from a controller.

V_{DD}

The V_{DD} pin is the power supply terminal. It is monitored by the ISL88011, ISL88012 and ISL88013. For these devices, the voltage at this pin is compared against an internal factory-programmed voltage trip point, V_{THVDD}. A reset is first asserted when the device is initially powered up to ensure that the power supply has stabilized. Thereafter, reset is again asserted whenever V_{DD} falls below V_{THVDD}. The device is designed with hysteresis to help prevent chattering due to noise.

VMON

The VMON pin on the ISL88012, ISL88014 and ISL88015 is a monitored input voltage that is user-adjustable. The voltage at this pin is compared against an internal 600mV reference voltage (V_{THVMON}) and a reset is asserted whenever the monitored voltage falls below this trip point.

WDI

The Watchdog Input takes an input from a microprocessor and ensures that it periodically toggles the WDI pin, otherwise the internal watchdog timer runs out and reset is asserted. The internal Watchdog Timer is cleared whenever the WDI input pin sees a rising or falling edge or the device is manually reset.

C_{POR}

The C_{POR} input pin lets users increase the Power-On Reset timeout delay (t_{POR}) by connecting a capacitor between C_{POR} and ground. (See Figure 3)

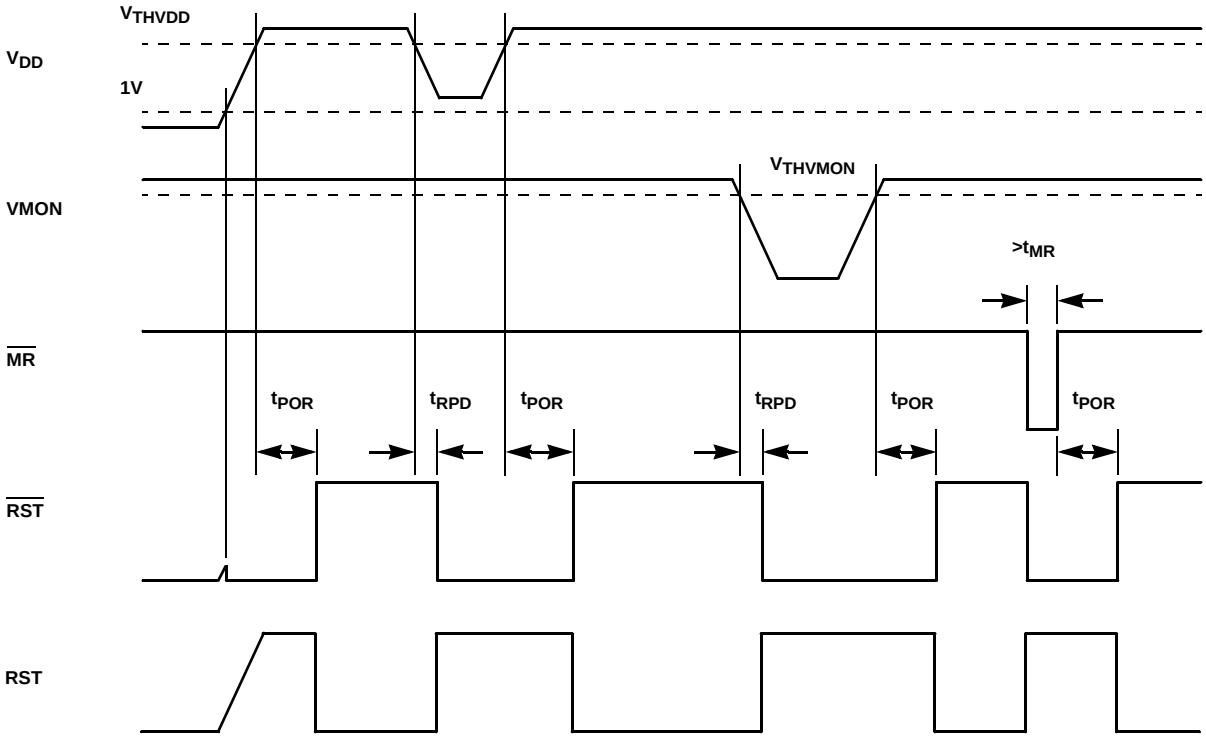

FIGURE 1. VOLTAGE MONITORING TIMING DIAGRAM

Principles of Operation

The ISL88011, ISL88012, ISL88013, ISL88014, ISL88015 devices provide those functions needed for critical voltage monitoring. These features include Power-On Reset control, customizable supply voltage supervision, Watchdog Timer capability, and manual reset assertion. By integrating all of these features into a small 5 Ld SOT-23 package and using only 5.5µA of supply current, the ISL88011, ISL88012, ISL88013, ISL88014, ISL88015 devices can assist in lowering system cost, reducing board space requirements, and increasing the reliability of a system.

Low Voltage Monitoring

During normal operation, these supervisors monitor both the voltage level of V_{DD} (ISL88011, ISL88012, ISL88013) and/or VMON (ISL88012, ISL88014, ISL88015). The device asserts a reset if any of these voltages falls below their respective trip points. The reset signal effectively prevents the system from operating during a power failure or brownout condition. This reset signal remains asserted until V_{DD} and the voltage on VMON exceed their voltage threshold setting for the reset time delay period t_{POR} of 200ms (See Figure 1)

The ISL88012, ISL88014 and ISL88015 allow users to customize the minimum voltage sense level on the VMON input pin. To do this, connect an external resistor divider network to the VMON pin in order to set the trip point to some voltage above 600mV according to the following Equation 1 (See Figure 2).

:

$$V_{INTRIP} = 0.6 \times \frac{(R_1 + R_2)}{R_2} \quad \text{(EQ. 1)}$$

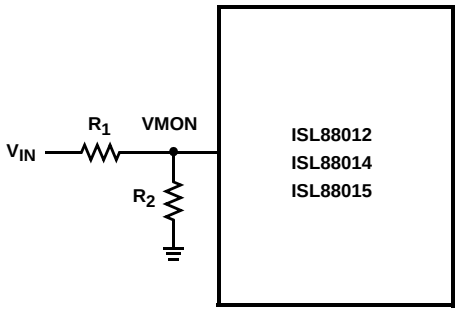

FIGURE 2. USING VMON TO MONITOR V_{IN} VIA RESISTORS

Power-On Reset (POR)

Applying at least 1V to the V_{DD} pin activates a POR circuit which asserts reset (i.e., RST goes HIGH while $\overline{RST}$ goes LOW). The reset signals remain asserted until the voltage at V_{DD} and/or VMON rise above the minimum voltage sense level for time period t_{POR}. This ensures that the voltages have stabilized.

These reset signals provide several benefits:

- It prevents the system microprocessor from starting to operate with insufficient voltage.
- It prevents the processor from operating prior to stabilization of the oscillator.
- It ensures that the monitored device is held out of operation until internal registers are properly loaded.
- It allows time for an FPGA to download its configuration prior to initialization of the circuit.

Adjusting POR Timeout via C_{POR} Pin

On the ISL88011 and ISL88014, users can adjust the Power-On Reset timeout delay (t_{POR}) up to many times the normal t_{POR} of 250ms. To do this, connect a capacitor between C_{POR} and ground (see Figure 3). For example, connecting a 30pF capacitor to C_{POR} will increase t_{POR} from a typical 250ms to about 2.5s. **NOTE:** Care should be taken in PCB layout and capacitor placement in order to reduce stray capacitance as much as possible, which lengthens the t_{POR} timeout period.

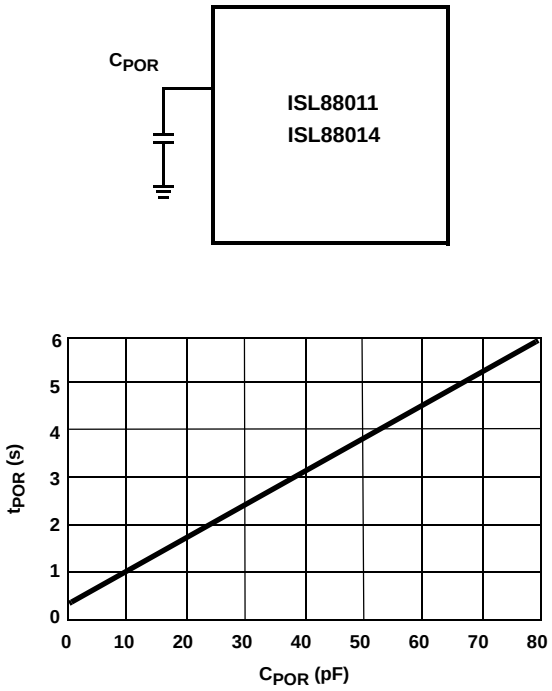

FIGURE 3. ADJUSTING t_{POR} WITH A CAPACITOR

Manual Reset

The manual reset input ($\overline{MR}$) allows the user to trigger a reset by using a push-button switch. The $\overline{MR}$ input is an active-low debounced input. By connecting a push-button directly from $\overline{MR}$ to ground, the designer adds manual system reset capability (see Figure 4). Reset is asserted if the $\overline{MR}$ pin is pulled low to less than 100mV for 1µs or longer while the push-button is closed. After $\overline{MR}$ is released, the reset outputs remain asserted for t_{POR} (200ms) and then released.

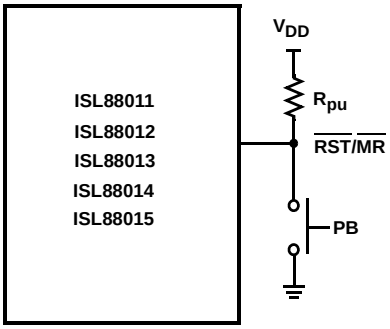

FIGURE 4. CONNECTING A MANUAL RESET PUSH-BUTTON

Watchdog Timer

The Watchdog Timer circuit checks microprocessor activity by monitoring the WDI input pin. The microprocessor must periodically toggle the WDI pin within t_{WDT} (1.6s nominal), otherwise the reset signal is asserted (see Figure 5). Internally, the 1.6s timer is cleared by either a reset or by toggling the WDI input.

Besides the 1.6s default timeout during normal operation, these devices also have a longer 51s timeout for start-up. During this time, a reset cannot be asserted due to the WDI not being toggled. The longer delay at power-on allows an operating system to boot, an FPGA to initialize, or the system software to initialize without the burden of dealing with the Watchdog.

Symbol Table

WAVEFORM	INPUTS	OUTPUTS
	Must be steady	Will be steady
	May change from LOW to HIGH	Will change from LOW to HIGH
	May change from HIGH to LOW	Will change from HIGH to LOW
	Don't Care: Changes Allowed	Changing: State Not Known
	N/A	Center Line is High Impedance

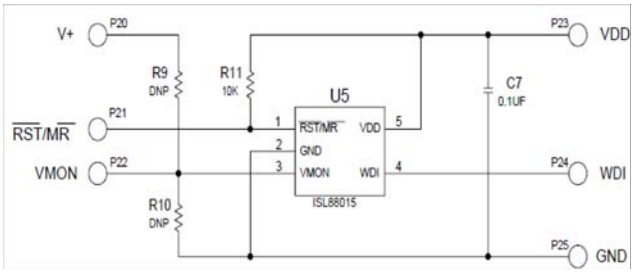

FIGURE 21. ISL88015EVAL1Z

Each of the ISL8801X parts has its own evaluation board provided with minimal customization, allowing the user to program with passive components both the POR timing and adjustable VMON thresholds, where applicable. The ISL88011EVAL1Z, ISL88012EVAL1Z and ISL88013EVAL1Z have a 4.6V Vth part installed.

NOTES:

1. Dimensioning and tolerance per ASME Y14.5M-1994.
2. Package conforms to EIAJ SC-74 and JEDEC MO178AA.
3. Package length and width are exclusive of mold flash, protrusions, or gate burrs.
4. Footlength measured at reference to gauge plane.
5. Lead thickness applies to the flat section of the lead between 0.08mm and 0.15mm from the lead tip.
6. Controlling dimension: MILLIMETER. Dimensions in ( ) for reference only.
