

Features

- Output voltage tolerance $\leq \pm 2\%$
- 150 mA current capability
- Very low current consumption
- Early warning
- Reset output low down to $V_Q = 1\text{ V}$
- Overtemperature protection
- Reverse polarity proof
- Adjustable reset threshold
- Very low drop voltage
- Wide temperature range
- Integrated pull-up resistor at logic outputs
- Green Product (RoHS compliant)
- AEC Qualified

Functional Description

This device is an automotive suited voltage regulator with a fixed 5-V output. The maximum operating voltage is 45 V. The output is able to drive 150 mA load. It is short circuit protected and the thermal shutdown switches the output off if the junction temperature is in excess of 150 °C. A reset signal is generated for an output voltage of $V_Q < 4.65\text{ V}$. The reset threshold voltage can be decreased by external connection of a voltage divider. The reset delay time can be set by an external capacitor. Reset and sense output have integrated pull-up resistors. If the integrated resistors are not desired TLE 4279 can be used. It is also possible to supervise the input voltage by using an integrated comparator to give a low voltage warning.

Type	Package
TLE 4269 G	PG-DSO-8
TLE 4269 GM	PG-DSO-14
TLE 4269 GL	PG-DSO-20

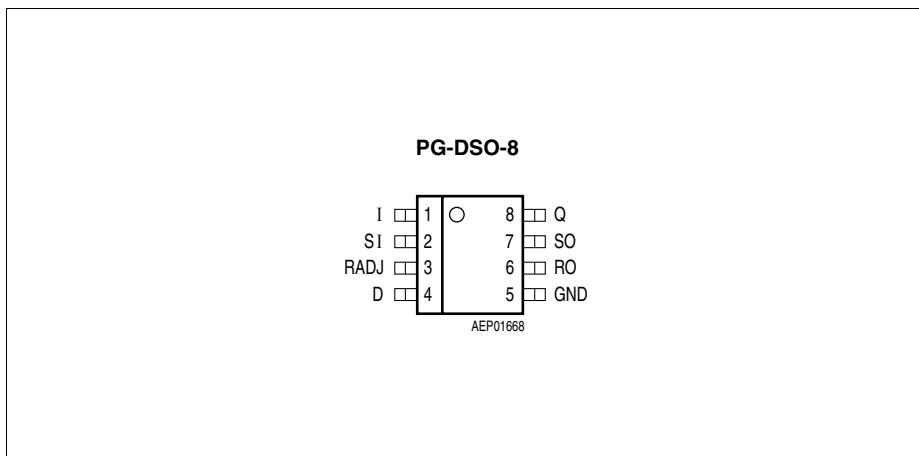

Figure 1 Pin Configuration (top view)

Table 1 Pin Definitions and Functions (TLE 4269 G)

Pin No.	Symbol	Function
1	I	Input ; block to GND directly at the IC with a ceramic capacitor.
2	SI	Sense Input ; if not needed connect to Q.
3	RADJ	Reset Threshold Adjust ; if not needed connect to GND.
4	D	Reset Delay ; to select delay time, connect to GND via capacitor.
5	GND	Ground
6	RO	Reset Output ; the open-collector output is internally linked to Q via a 20 k Ω pull-up resistor. Keep open, if not needed.
7	SO	Sense Output ; the open-collector output is internally linked to the output via a 20 k Ω pull-up resistor. Keep open, if not needed.
8	Q	5-V Output ; connect to GND with a 10 μ F capacitor, ESR < 10 Ω .

Table 3 Pin Definitions and Functions (TLE 4269 GL)

Pin No.	Symbol	Function
1	RADJ	Reset Threshold Adjust ; if not needed connect to ground.
2	D	Reset Delay ; to select delay time, connect to GND via external capacitor.
4 - 7, 14 - 17	GND	Ground
10	RO	Reset Output ; the open-collector output is internally linked to Q via a 20 k Ω pull-up resistor. Keep open, if not needed.
11	SO	Sense Output ; the open-collector output is internally linked to the output via a 20 k Ω pull-up resistor. Keep open, if not needed.
12	Q	Output ; connect to GND with a 10 μ F capacitor, ESR < 10 Ω .
19	I	Input ; block directly at the IC by a ceramic capacitor.
20	SI	Sense Input ; if not needed connect to Q.

Circuit Description

The control amplifier compares a reference voltage, made highly accurate by resistance balancing, with a voltage proportional to the output voltage and drives the base of the series PNP transistor via a buffer. Saturation control as a function of the load current prevents any over-saturation of the power element.

The reset output RO is in high-state if the voltage on the delay capacitor C_D is greater or equal V_{UD} . The delay capacitor C_D is charged with the current I_D for output voltages greater than the reset threshold V_{RT} . If the output voltage gets lower than V_{RT} ('reset condition') a fast discharge of the delay capacitor C_D sets in and as soon as V_D gets lower than V_{LD} the reset output RO is set to low-level.

The time gap for the delay capacitor discharge is the reset reaction time t_{RR} .

The reset threshold V_{RT} can be decreased via an external voltage divider connected to the pin RADJ. In this case the reset condition is reached if $V_Q < V_{RT}$ and $V_{RADJ} < V_{RAQDJ, TH}$. Dimensioning the voltage divider (Figure 5) according to:

$$V_{THRES} = V_{RADJ, TH} \times (R_{ADJ1} + R_{ADJ2}) / R_{ADJ2}, \quad (1)$$

the reset threshold can be decreased down to 3.5 V. If the reset-adjust-option is not needed the RADJ-pin should be connected to GND causing the reset threshold to go to its default value (typ. 4.65 V).

A built in comparator compares the signal of the pin SI, normally fed by a voltage divider from the input voltage, with the reference and gives an early warning on the pin SO. It is also possible to supervise another voltage e.g. of a second regulator, or to build a watchdog circuit with few external components.

Application Description

The input capacitor C_I is necessary for compensating line influences. Using a resistor of approx. 1 Ω in series with C_I , the oscillating circuit consisting of input inductivity and input capacitance can be damped. The output capacitor C_O is necessary for the stability of the regulating circuit. Stability is guaranteed at values $\geq 10 \mu F$ and an $ESR \leq 10 \Omega$ within the operating temperature range. For small tolerances of the reset delay the spread of the capacitance of the delay capacitor and its temperature coefficient should be noted.
