

512 bit (64 bit x 8) SERIAL ACCESS TIMEKEEPER[®] SRAM

FEATURES SUMMARY

- 2.0 TO 5.5V CLOCK OPERATING VOLTAGE
- COUNTERS FOR SECONDS, MINUTES, HOURS, DAY, DATE, MONTH, YEARS and CENTURY
- YEAR 2000 COMPLIANT
- SOFTWARE CLOCK CALIBRATION
- AUTOMATIC SWITCH-OVER and DESELECT CIRCUITRY
- I²C BUS COMPATIBLE
- 56 BYTES of GENERAL PURPOSE RAM
- ULTRA-LOW BATTERY SUPPLY CURRENT OF 1μA
- LOW OPERATING CURRENT OF 300μA
- BATTERY OR SUPER-CAP BACK-UP
- BATTERY BACK-UP NOT RECOMMENDED FOR 3.0V APPLICATIONS (CAPACITOR BACK-UP ONLY)
- OPERATING TEMPERATURE OF -40 TO 85°C
- AUTOMATIC LEAP YEAR COMPENSATION
- SPECIAL SOFTWARE PROGRAMMABLE OUTPUT
- PACKAGING INCLUDES a 28-LEAD SOIC and SNAPHAT[®] TOP (to be ordered separately; 3.3V to 5.0V supply voltage only)

SUMMARY DESCRIPTION

The M41T11 TIMEKEEPER® RAM is a low power 512-bit, static CMOS RAM organized as 64 words by 8 bits. A built-in 32.768 kHz oscillator (external crystal controlled) and the first 8 bytes of the RAM are used for the clock/calendar function and are configured in binary coded decimal (BCD) format. Addresses and data are transferred serially via a two-line bi-directional bus. The built-in address register is incremented automatically after each write or read data byte.

The M41T11 clock has a built-in power sense circuit which detects power failures and automatically switches to the battery supply during power failures. The energy needed to sustain the RAM and clock operations can be supplied from a small lithium coin cell.

Typical data retention time is in excess of 5 years with a 50mA/h 3V lithium cell. The M41T11 is supplied in 8 lead Plastic Small Outline package or 28 lead SNAPHAT® package.

The 28-pin, 330mil SOIC provides sockets with gold plated contacts at both ends for direct connection to a separate SNAPHAT housing containing the battery and crystal. The unique design allows the SNAPHAT battery package to be mounted on top of the SOIC package after the completion of the surface mount process. Insertion of the SNAPHAT housing after reflow prevents potential battery and crystal damage due to the high temperatures required for device surface-mounting. The SNAPHAT housing is keyed to prevent reverse insertion. The SOIC and battery/crystal packages are shipped separately in plastic anti-static tubes or in Tape & Reel form.

For the 28-lead SOIC, the battery/crystal package (i.e. SNAPHAT) part number is “M4Txx-BR12SH” (see Table 12, page 18).

Caution: Do not place the SNAPHAT battery/crystal package “M4Txx-BR12SH” in conductive foam since this will drain the lithium button-cell battery.

MAXIMUM RATING

Stressing the device above the rating listed in the “Absolute Maximum Ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is

not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Table 2. Absolute Maximum Ratings

Symbol	Parameter		Value	Unit
T _A	Ambient Operating Temperature		–40 to 85	°C
T _{STG}	Storage Temperature (V _{CC} Off, Oscillator Off)	SNAPHAT®	–40 to 85	°C
		SOIC	–55 to 125	
T _{SLD} ⁽¹⁾	Lead Solder Temperature for 10 seconds		260	°C
V _{IO}	Input or Output Voltages		–0.3 to 7	V
V _{CC}	Supply Voltage		–0.3 to 7	V
I _O	Output Current		20	mA
P _D	Power Dissipation		0.25	W

Note: 1. Reflow at peak temperature of 215°C to 225°C for < 60 seconds (total thermal budget not to exceed 180°C for between 90 and 120 seconds).

CAUTION: Negative undershoots below –0.3V are not allowed on any pin while in the Battery Back-up mode.

CAUTION: Do NOT wave solder SOIC to avoid damaging SNAPHAT sockets.

DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, as well as the DC and AC characteristics of the device. The parameters in the following DC and AC Characteristic tables are derived from tests performed under the Measure-

ment Conditions listed in the relevant tables. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.

Table 3. Operating and AC Measurement Conditions

Parameter	M41T11	Unit
Supply Voltage (V_{CC})	2.0 to 5.5 ⁽¹⁾	V
Ambient Operating Temperature (T_A)	-40 to 85	°C
Load Capacitance (C_L)	100	pF
Input Rise and Fall Times	≤ 50	ns
Input Pulse Voltages	$0.2V_{CC}$ to $0.8V_{CC}$	V
Input and Output Timing Ref. Voltages	$0.3V_{CC}$ to $0.7V_{CC}$	V

Note: Output Hi-Z is defined as the point where data is no longer driven.

1. Supply Voltage for SOH28 is 3.3V to 5.5V.

Figure 7. AC Testing Input/Output Waveform

Table 4. Capacitance

Symbol	Parameter ^(1,2)	Min	Max	Unit
C_{IN}	Input Capacitance (SCL)		7	pF
$C_{OUT}^{(3)}$	Output Capacitance (SDA, FT/OUT)		10	pF
t_{LP}	Low-pass filter input time constant (SDA and SCL)	250	1000	ns

Note: 1. Effective capacitance measured with power supply at 5V; sampled only, not 100% tested.

2. At 25°C, $f = 1\text{MHz}$.

3. Outputs deselected.

Table 5. DC Characteristics

Symbol	Parameter	Test Condition ⁽¹⁾	Min	Typ	Max	Unit
I_{LI}	Input Leakage Current	$0V \leq V_{IN} \leq V_{CC}$			± 1	μA
I_{LO}	Output Leakage Current	$0V \leq V_{OUT} \leq V_{CC}$			± 1	μA
I_{CC1}	Supply Current	Switch Frequency = 100kHz			300	μA
I_{CC2}	Supply Current (Standby)	SCL, SDA = $V_{CC} - 0.3V$			70	μA
V_{IL}	Input Low Voltage		-0.3		$0.3V_{CC}$	V
V_{IH}	Input High Voltage		$0.7V_{CC}$		$V_{CC} + 0.5$	V
V_{OL}	Output Low Voltage	$I_{OL} = 3mA$			0.4	V
$V_{BAT}^{(2)}$	Battery Supply Voltage		$2.5^{(3)}$	3	$3.5^{(4)}$	V
I_{BAT}	Battery Supply Current	$T_A = 25^\circ C$, $V_{CC} = 0V$, Oscillator ON, $V_{BAT} = 3V$		0.8	1	μA

Note: 1. Valid for Ambient Operating Temperature: $T_A = -40$ to $85^\circ C$; $V_{CC} = 2.0$ to $5.5V$ (except where noted).
 2. STMicroelectronics recommends the RAYOVAC BR1225 or BR1632 (or equivalent) as the battery supply.
 3. After switchover (V_{SO}), $V_{BAT(min)}$ can be $2.0V$ for crystal with $R_S = 40K\Omega$.
 4. For rechargeable back-up, $V_{BAT(max)}$ may be considered V_{CC} .

Table 6. Crystal Electrical Characteristics

Symbol	Parameter ^(1,2,3)	Min	Typ	Max	Unit
f_O	Resonant Frequency		32.768		kHz
R_S	Series Resistance			60	$k\Omega$
C_L	Load Capacitance		12.5		pF

Note: 1. These values are externally supplied if using the SO8 package. STMicroelectronics recommends the KDS DT-38: 1TA/1TC252E127, Tuning Fork Type (thru-hole) or the DMX-26S: 1TJS125FH2A212, (SMD) quartz crystal for industrial temperature operations. KDS can be contacted at kouhou@kdsj.co.jp or <http://www.kdsj.co.jp> for further information on this crystal type.
 2. Load capacitors are integrated within the M41T00. Circuit board layout considerations for the 32.768kHz crystal of minimum trace lengths and isolation from RF generating signals should be taken into account.
 3. All SNAPHAT[®] battery/crystal tops meet these specifications.

OPERATION

The M41T11 clock operates as a slave device on the serial bus. Access is obtained by implementing a start condition followed by the correct slave address (D0h). The 64 bytes contained in the device can then be accessed sequentially in the following order:

1. Seconds Register
2. Minutes Register
3. Century/Hours Register
4. Day Register
5. Date Register
6. Month Register
7. Years Register
8. Control Register

9 to 64. RAM

The M41T11 clock continually monitors V_{CC} for an out of tolerance condition. Should V_{CC} fall below V_{SO} , the device terminates an access in progress and resets the device address counter. Inputs to the device will not be recognized at this time to prevent erroneous data from being written to the device from an out of tolerance system. When V_{CC} falls below V_{SO} , the device automatically switches over to the battery and powers down into an ultra low current mode of operation to conserve battery life. Upon power-up, the device switches from battery to V_{CC} at V_{SO} and recognizes inputs.

2-Wire Bus Characteristics

This bus is intended for communication between different ICs. It consists of two lines: one bi-directional for data signals (SDA) and one for clock signals (SCL). Both the SDA and the SCL lines must be connected to a positive supply voltage via a pull-up resistor.

The following protocol has been defined:

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is High.
- Changes in the data line while the clock line is High will be interpreted as control signals.

Accordingly, the following bus conditions have been defined:

Bus not busy. Both data and clock lines remain High.

Start data transfer. A change in the state of the data line, from High to Low, while the clock is High, defines the START condition.

Stop data transfer. A change in the state of the data line, from Low to High, while the clock is High, defines the STOP condition.

Data valid. The state of the data line represents valid data when after a start condition, the data line is stable for the duration of the High period of the clock signal. The data on the line may be changed during the Low period of the clock signal. There is one clock pulse per bit of data.

Each data transfer is initiated with a start condition and terminated with a stop condition. The number of data bytes transferred between the start and stop conditions is not limited. The information is transmitted byte-wide and each receiver acknowledges with a ninth bit.

By definition, a device that gives out a message is called "transmitter", the receiving device that gets the message is called "receiver". The device that controls the message is called "master". The devices that are controlled by the master are called "slaves".

Acknowledge. Each byte of eight bits is followed by one Acknowledge Bit. This Acknowledge Bit is a low level put on the bus by the receiver, whereas the master generates an extra acknowledge related clock pulse.

A slave receiver which is addressed is obliged to generate an acknowledge after the reception of each byte. Also, a master receiver must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter.

The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is a stable Low during the High period of the acknowledge related clock pulse. Of course, setup and hold times must be taken into account. A master receiver must signal an end-of-data to the slave transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this case, the transmitter must leave the data line High to enable the master to generate the STOP condition.

Figure 8. Serial Bus Data Transfer Sequence

Figure 9. Acknowledgement Sequence

Figure 10. Bus Timing Requirements Sequence

Note: P = STOP and S = START

Table 7. AC Characteristics

Symbol	Parameter ⁽¹⁾	Min	Max	Unit
f _{SCL}	SCL Clock Frequency	0	100	kHz
t _{LOW}	Clock Low Period	4.7		μs
t _{HIGH}	Clock High Period	4		μs
t _R	SDA and SCL Rise Time		1	μs
t _F	SDA and SCL Fall Time		300	ns
t _{HD:STA}	START Condition Hold Time (after this period the first clock pulse is generated)	4		μs
t _{SU:STA}	START Condition Setup Time (only relevant for a repeated start condition)	4.7		μs
t _{SU:DAT}	Data Setup Time	250		ns
t _{HD:DAT} ⁽¹⁾	Data Hold Time	0		μs
t _{SU:STO}	STOP Condition Setup Time	4.7		μs
t _{BUF}	Time the bus must be free before a new transmission can start	4.7		μs

Note: 1. Valid for Ambient Operating Temperature: T_A = -40 to 85°C; V_{CC} = 2.0 to 5.5V (except where noted).

2. Transmitter must internally provide a hold time to bridge the undefined region (300ns max.) of the falling edge of SCL.

READ Mode

In this mode, the master reads the M41T11 slave after setting the slave address (see Figure 11). Following the write Mode Control Bit ($R/W = 0$) and the Acknowledge Bit, the word address A_n is written to the on-chip address pointer. Next the START condition and slave address are repeated, followed by the READ Mode Control Bit ($R/W = 1$). At this point, the master transmitter becomes the master receiver. The data byte which was addressed will be transmitted and the master receiver will send an Acknowledge Bit to the slave transmitter. The address pointer is only incremented on reception of an Acknowledge Bit. The M41T11 slave transmitter will now place the data byte at address $A_n + 1$ on the bus. The master receiver reads and acknowledges the new byte and the address pointer is incremented to $A_n + 2$.

This cycle of reading consecutive addresses will continue until the master receiver sends a STOP condition to the slave transmitter.

An alternate READ mode may also be implemented, whereby the master reads the M41T11 slave

without first writing to the (volatile) address pointer. The first address that is read is the last one stored in the pointer (see Figure 13, page 13).

WRITE Mode

In this mode the master transmitter transmits to the M41T11 slave receiver. Bus protocol is shown in Figure 11. Following the START condition and slave address, a logic '0' ($R/W = 0$) is placed on the bus and indicates to the addressed device that word address A_n will follow and is to be written to the on-chip address pointer. The data word to be written to the memory is strobed in next and the internal address pointer is incremented to the next memory location within the RAM on the reception of an acknowledge clock. The M41T11 slave receiver will send an acknowledge clock to the master transmitter after it has received the slave address and again after it has received the word address and each data byte (see Figure 10, page 10).

Figure 11. Slave Address Location

Figure 12. READ Mode Sequence

Figure 13. Alternate READ Mode Sequence

Figure 14. WRITE Mode Sequence

Data Retention Mode

With valid V_{CC} applied, the M41T11 can be accessed as described above with read or write cycles. Should the supply voltage decay, the

M41T11 will automatically deselect, write protecting itself when V_{CC} falls (see Figure 15).

Figure 15. Power Down/Up Mode AC Waveforms

Table 8. Power Down/Up AC Characteristics

Symbol	Parameter ⁽¹⁾	Min	Max	Unit
$t_{PD}^{(2)}$	SCL and SDA at V_{IH} before Power Down	0		ns
t_{REC}	SCL and SDA at V_{IH} after Power Up	10		μs

Note: 1. Valid for Ambient Operating Temperature: $T_A = -40$ to $85^\circ C$; $V_{CC} = 2.0$ to $5.5V$ (except where noted).

2. V_{CC} fall time should not exceed $5mV/\mu s$.

Table 9. Power Down/Up Trip Points DC Characteristics

Symbol	Parameter ^(1,2)	Min	Typ	Max ⁽³⁾	Unit
$V_{SO}^{(4)}$	Battery Back-up Switchover Voltage	$V_{BAT} - 0.80$	$V_{BAT} - 0.50$	$V_{BAT} - 0.30$	V

Note: 1. Valid for Ambient Operating Temperature: $T_A = -40$ to $85^\circ C$; $V_{CC} = 2.0$ to $5.5V$ (except where noted).

2. All voltages referenced to V_{SS} .

3. In 3.3V application, if initial battery voltage is $\geq 3.4V$, it may be necessary to reduce battery voltage (i.e., through wave soldering the battery) in order to avoid inadvertent switchover/deselection for $V_{CC} - 10\%$ operation.

4. Switch-over and deselect point.

CLOCK OPERATION

The eight byte clock register (see Table 10) is used to both set the clock and to read the date and time from the clock, in a binary coded decimal format. Seconds, Minutes, and Hours are contained within the first three registers. Bits D6 and D7 of clock register 2 (Hours Register) contain the CENTURY ENABLE Bit (CEB) and the CENTURY Bit (CB). Setting CEB to a '1' will cause CB to toggle, either from '0' to '1' or from '1' to '0' at the turn of the century (depending upon its initial state). If CEB is set to a '0', CB will not toggle. Bits D0 through D2 of register 3 contain the Day (day of week). Registers 4, 5 and 6 contain the Date (day of month), Month and Years. The final register is the Control Register (this is described in the Clock Calibration section). Bit D7 of register 0 contains the STOP Bit (ST). Setting this bit to a '1' will cause the oscillator to stop. If the device is expected to spend a significant amount of time on the shelf, the oscillator may be stopped to reduce current drain.

When reset to a '0' the oscillator restarts within one second.

Note: In order to guarantee oscillator start-up after the initial power-up, set the ST Bit to a '1,' then reset this bit to a '0.' This sequence enables a “kick start” circuit which aids the oscillator start-up during worst case conditions of voltage and temperature.

The seven Clock Registers may be read one byte at a time, or in a sequential block. The Control Register (Address location 7) may be accessed independently. Provision has been made to assure that a clock update does not occur while any of the seven clock addresses are being read. If a clock address is being read, an update of the clock registers will be delayed by 250ms to allow the read to be completed before the update occurs. This will prevent a transition of data during the read.

Note: This 250ms delay affects only the clock register update and does not alter the actual clock time.

Table 10. Register Map

Address	Data								Function/Range BCD Format	
	D7	D6	D5	D4	D3	D2	D1	D0		
0	ST	10 Seconds			Seconds				Seconds	00-59
1	X	10 Minutes			Minutes				Minutes	00-59
2	CEB ⁽¹⁾	CB	10 Hours		Hours				Century/Hours	0-1/00-23
3	X	X	X	X	X	Day			Day	01-07
4	X	X	10 Date		Date				Date	01-31
5	X	X	X	10 M.	Month				Month	01-12
6	10 Years				Years				Year	00-99
7	OUT	FT	S	Calibration					Control	

Keys: S = SIGN Bit

FT = FREQUENCY TEST Bit

ST = STOP Bit

OUT = Output level

X = Don't care

CEB = Century Enable Bit

CB = Century Bit

Note: 1. When CEB is set to '1', CB will toggle from '0' to '1' or from '1' to '0' every 100 years (dependent upon the initial value set). When CEB is set to '0', CB will not toggle.

Clock Calibration

The M41T11 is driven by a quartz controlled oscillator with a nominal frequency of 32,768Hz. The devices are tested not to exceed 35ppm (parts per million) oscillator frequency error at 25°C, which equates to about ± 1.53 minutes per month. With the calibration bits properly set, the accuracy of each M41T11 improves to better than $\pm 1/-2$ ppm at 25°C.

The oscillation rate of any crystal changes with temperature (see Figure 16, page 17). Most clock chips compensate for crystal frequency and temperature shift error with cumbersome trim capacitors. The M41T11 design, however, employs periodic counter correction. The calibration circuit adds or subtracts counts from the oscillator divider circuit at the divide by 256 stage, as shown in Figure 17, page 17. The number of times pulses are blanked (subtracted, negative calibration) or split (added, positive calibration) depends upon the value loaded into the five-bit Calibration byte found in the Control Register. Adding counts speeds the clock up, subtracting counts slows the clock down.

The Calibration byte occupies the five lower order bits (D4-D0) in the Control register (Addr 7). This byte can be set to represent any value between 0 and 31 in binary form. Bit D5 is a Sign Bit; '1' indicates positive calibration, '0' indicates negative calibration. Calibration occurs within a 64minute cycle. The first 62 minutes in the cycle may, once per minute, have one second either shortened by 128 or lengthened by 256 oscillator cycles. If a binary '1' is loaded into the register, only the first 2 minutes in the 64 minute cycle will be modified; if a binary 6 is loaded, the first 12 will be affected, and so on.

Therefore, each calibration step has the effect of adding 512 or subtracting 256 oscillator cycles for every 125,829,120 actual oscillator cycles, that is $+4.068$ or -2.034 ppm of adjustment per calibration step in the calibration register. Assuming that the oscillator is in fact running at exactly 32,768Hz, each of the 31 increments in the Calibration byte would represent $+10.7$ or -5.35 seconds per

month which corresponds to a total range of $+5.5$ or -2.75 minutes per month.

Two methods are available for ascertaining how much calibration a given M41T11 may require. The first involves simply setting the clock, letting it run for a month and comparing it to a known accurate reference (like WWV broadcasts). While that may seem crude, it allows the designer to give the end user the ability to calibrate his clock as his environment may require, even after the final product is packaged in a non-user serviceable enclosure. All the designer has to do is provide a simple utility that accessed the Calibration byte.

The second approach is better suited to a manufacturing environment, and involves the use of some test equipment. When the Frequency Test (FT) Bit, the seventh-most significant bit in the Control Register, is set to a '1', and the oscillator is running at 32,768Hz, the FT/OUT pin of the device will toggle at 512Hz. Any deviation from 512Hz indicates the degree and direction of oscillator frequency shift at the test temperature.

For example, a reading of 512.01024Hz would indicate a $+20$ ppm oscillator frequency error, requiring a -10 (XX001010) to be loaded into the Calibration Byte for correction. Note that setting or changing the Calibration Byte does not affect the Frequency test output frequency.

Output Driver Pin

When the FT Bit is not set, the FT/OUT pin becomes an output driver that reflects the contents of D7 of the control register. In other words, when D6 of location 7 is a zero and D7 of location 7 is a zero and then the FT/OUT pin will be driven low.

Note: The FT/OUT pin is open drain which requires an external pull-up resistor.

Preferred Initial Power-on Defaults

Upon initial application of power to the device, the FT Bit will be set to a '0' and the OUT Bit will be set to a '1'. All other Register bits will initially power-on in a random state.

REVISION HISTORY**Table 17. Document Revision History**

Date	Rev. #	Revision Details
March 1999	1.0	First Issue
12/23/99	1.1	SOH28 package added
07/25/00	1.2	Crystal Electrical Characteristics: R_S Max changed (Table 6)
12/12/00	1.3	Edit V_{SO} (Table 9)
01/24/01	2.0	Reformatted
2/27/01	3.0	Document Status changed
07/17/01	3.1	Change to DC and AC Characteristics (Tables 5, 7); added temp/voltage info. to tables (Table 4, 5, 6, 7, 8, 9); added SNAPHAT Battery table (Table 12).
11/27/01	3.2	Features, (page 1); DC Characteristics (Table 5); Crystal Electrical (Table 6); Power Down/Up Trip Points (Table 9) changes; add table footnotes (Table 3, 9, 11)
01/21/02	3.3	Fix table footnotes (Table 5, 6)
05/01/02	3.4	Modify reflow time and temperature footnote (Table 2)
07/03/02	3.5	Modify "Clock Operation" text, Crystal Electrical Characteristics table footnote (Table 6)
11/07/02	3.6	Correct figure name (Figure 1)
