**Register 10: CAN IF1 Command Mask (CANIF1CMSK), offset 0x024****Register 11: CAN IF2 Command Mask (CANIF2CMSK), offset 0x084**

Reading the Command Mask registers provides status for various functions. Writing to the Command Mask registers specifies the transfer direction and selects which buffer registers are the source or target of the data transfer.

Note that when a read from the message object buffer occurs when the WRNRD bit is clear and the CLRINTPND and/or NEWDAT bits are set, the interrupt pending and/or new data flags in the message object buffer are cleared.

**CAN IF1 Command Mask (CANIF1CMSK)**

CAN0 base: 0x4004.0000

Offset 0x024

Type R/W, reset 0x0000.0000

| 1         | If WRNRD is clear, the new data status is cleared in the message buffer. Note the value of this bit that is transferred to the <b>CANIFnMCTL</b> register always reflects the status of the bits before clearing.<br>If WRNRD is set, a transmission is requested. Note that when this bit is set, the TXRQST bit in the <b>CANIFnMCTL</b> register is ignored. |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |             |   |                                                                                                                                                                                                         |   |                                                                                                                                                                                                                                                                                                                                                                 |

Register 12: CAN IF1 Mask 1 (CANIF1MSK1), offset 0x028

Register 13: CAN IF2 Mask 1 (CANIF2MSK1), offset 0x088

The mask information provided in this register accompanies the data (**CANIFnDAn**), arbitration information (**CANIFnARBn**), and control information (**CANIFnMCTL**) to the message object in the message RAM. The mask is used with the ID bit in the **CANIFnARBn** register for acceptance filtering. Additional mask information is contained in the **CANIFnMSK2** register.

When the message handler stores a data frame, it writes DLC to the value given by the received message. | Value | Description | 0x0-0x8 | Specifies the number of bytes in the data frame.                                                | 0x9-0xF | Defaults to a data frame with 8 bytes.                         |
| Value     | Description                                                                                     |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |             |         |                                                                                                 |         |                                                                |
| 0x0-0x8   | Specifies the number of bytes in the data frame.                                                |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |             |         |                                                                                                 |         |                                                                |
| 0x9-0xF   | Defaults to a data frame with 8 bytes.                                                          |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |             |         |                                                                                                 |         |                                                                |

**Register 22: CAN IF1 Data A1 (CANIF1DA1), offset 0x03C**

**Register 23: CAN IF1 Data A2 (CANIF1DA2), offset 0x040**

**Register 24: CAN IF1 Data B1 (CANIF1DB1), offset 0x044**

**Register 25: CAN IF1 Data B2 (CANIF1DB2), offset 0x048**

**Register 26: CAN IF2 Data A1 (CANIF2DA1), offset 0x09C**

**Register 27: CAN IF2 Data A2 (CANIF2DA2), offset 0x0A0**

**Register 28: CAN IF2 Data B1 (CANIF2DB1), offset 0x0A4**

**Register 29: CAN IF2 Data B2 (CANIF2DB2), offset 0x0A8**

These registers contain the data to be sent or that has been received. In a CAN data frame, data byte 0 is the first byte to be transmitted or received and data byte 7 is the last byte to be transmitted or received. In CAN's serial bit stream, the MSB of each byte is transmitted first.

**Register 30: CAN Transmission Request 1 (CANTXRQ1), offset 0x100****Register 31: CAN Transmission Request 2 (CANTXRQ2), offset 0x104**

The **CANTXRQ1** and **CANTXRQ2** registers hold the TXRQST bits of the 32 message objects. By reading out these bits, the CPU can check which message object has a transmission request pending. The TXRQST bit of a specific message object can be changed by three sources: (1) the CPU via the **CANIFnMCTL** register, (2) the message handler state machine after the reception of a remote frame, or (3) the message handler state machine after a successful transmission.

The **CANTXRQ1** register contains the TXRQST bits of the first 16 message objects in the message RAM; the **CANTXRQ2** register contains the TXRQST bits of the second 16 message objects.

**Register 34: CAN Message 1 Interrupt Pending (CANMSG1INT), offset 0x140****Register 35: CAN Message 2 Interrupt Pending (CANMSG2INT), offset 0x144**

The **CANMSG1INT** and **CANMSG2INT** registers hold the INTPND bits of the 32 message objects. By reading these bits, the CPU can check which message object has an interrupt pending. The INTPND bit of a specific message object can be changed through two sources: (1) the CPU via the **CANIFnMCTL** register, or (2) the message handler state machine after the reception or transmission of a frame.

This field is also encoded in the **CANINT** register.

The **CANMSG1INT** register contains the INTPND bits of the first 16 message objects in the message RAM; the **CANMSG2INT** register contains the INTPND bits of the second 16 message objects.

## 19 Universal Serial Bus (USB) Controller

The Stellaris<sup>®</sup> USB controller operates as a full-speed or low-speed function controller during point-to-point communications with USB Host functions. The controller complies with the USB 2.0 standard, which includes SUSPEND and RESUME signaling. 32 endpoints including two hard-wired for control transfers (one endpoint for IN and one endpoint for OUT) plus 30 endpoints defined by firmware along with a dynamic sizable FIFO support multiple packet queueing.  $\mu$ DMA access to the FIFO allows minimal interference from system software. Software-controlled connect and disconnect allows flexibility during USB device startup.

The Stellaris USB module has the following features:

- Complies with USB-IF certification standards
- USB 2.0 full-speed (12 Mbps) and low-speed (1.5 Mbps) operation with integrated PHY
- 4 transfer types: Control, Interrupt, Bulk, and Isochronous
- 32 endpoints
  - 1 dedicated control IN endpoint and 1 dedicated control OUT endpoint
  - 15 configurable IN endpoints and 15 configurable OUT endpoints
- 4 KB dedicated endpoint memory: one endpoint may be defined for double-buffered 1023-byte isochronous packet size
- Efficient transfers using Micro Direct Memory Access Controller ( $\mu$ DMA)
  - Separate channels for transmit and receive for up to three IN endpoints and three OUT endpoints
  - Channel requests asserted when FIFO contains required amount of data

### 19.1 Block Diagram

## 19.2 Signal Description

The following table lists the external signals of the USB controller and describes the function of each. These signals have dedicated functions and are not alternate functions for any GPIO signals.

**Table 19-1. Signals for USB (100LQFP)**

| Pin Name  | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                              |
|-----------|------------|--------------------------|----------|--------------------------|--------------------------------------------------------------------------|
| USB0DM    | 70         | fixed                    | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0. |
| USB0DP    | 71         | fixed                    | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0. |
| USB0RBIAS | 73         | fixed                    | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

**Table 19-2. Signals for USB (108BGA)**

| Pin Name  | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                              |
|-----------|------------|--------------------------|----------|--------------------------|--------------------------------------------------------------------------|
| USB0DM    | C11        | fixed                    | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0. |
| USB0DP    | C12        | fixed                    | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0. |
| USB0RBIAS | B12        | fixed                    | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 19.3 Functional Description

**Note:** A 9.1-kΩ resistor should be connected between the USB0RBIAS and ground. The 9.1-kΩ resistor should have a 1% tolerance and should be located in close proximity to the USB0RBIAS pin. Power dissipation in the resistor is low, so a chip resistor of any geometry may be used.

The Stellaris USB controller provides the ability for the controller to serve as a Device-only controller. The controller can only be used in Device mode to connect USB-enabled peripherals to the USB controller. For Device mode, the USB controller requires a B connector in the system to provide Device connectivity.

**Note:** When USB is used in the system, the minimum system frequency is 20 MHz.

### 19.3.1 Operation

This section describes the Stellaris USB controller's actions. IN endpoints, OUT endpoints, entry into and exit from SUSPEND mode, and recognition of Start of Frame (SOF) are all described.

IN transactions are controlled by an endpoint's transmit interface and use the transmit endpoint registers for the given endpoint. OUT transactions are handled with an endpoint's receive interface and use the receive endpoint registers for the given endpoint.

When configuring the size of the FIFOs for endpoints, take into account the maximum packet size for an endpoint.

- **Bulk.** Bulk endpoints should be the size of the maximum packet (up to 64 bytes) or twice the maximum packet size if double buffering is used (described further in the following section).
- **Interrupt.** Interrupt endpoints should be the size of the maximum packet (up to 64 bytes) or twice the maximum packet size if double buffering is used.
- **Isochronous.** Isochronous endpoints are more flexible and can be up to 1023 bytes.
- **Control.** It is also possible to specify a separate control endpoint for a USB Device. However, in most cases the USB Device should use the dedicated control endpoint on the USB controller's endpoint 0.

### 19.3.1.1 Endpoints

The USB controller provides two dedicated control endpoints (IN and OUT) and 30 configurable endpoints (15 IN and 15 OUT) that can be used for communications with a Host controller. The endpoint number and direction associated with an endpoint is directly related to its register designation. For example, when the Host is transmitting to endpoint 1, all configuration and data is in the endpoint 1 transmit register interface.

Endpoint 0 is a dedicated control endpoint used for all control transactions to endpoint 0 during enumeration or when any other control requests are made to endpoint 0. Endpoint 0 uses the first 64 bytes of the USB controller's FIFO RAM as a shared memory for both IN and OUT transactions.

The remaining 30 endpoints can be configured as control, bulk, interrupt, or isochronous endpoints. They should be treated as 15 configurable IN and 15 configurable OUT endpoints. The endpoint pairs are not required to have the same type for their IN and OUT endpoint configuration. For example, the OUT portion of an endpoint pair could be a bulk endpoint, while the IN portion of that endpoint pair could be an interrupt endpoint. The address and size of the FIFOs attached to each endpoint can be modified to fit the application's needs.

### 19.3.1.2 IN Transactions

Data for IN transactions is handled through the FIFOs attached to the transmit endpoints. The sizes of the FIFOs for the 15 configurable IN endpoints are determined by the **USB Transmit FIFO Start Address (USBTXFIFOADD)** register. The maximum size of a data packet that may be placed in a transmit endpoint's FIFO for transmission is programmable and is determined by the value written to the **USB Maximum Transmit Data Endpoint n (USBTXMAXPn)** register for that endpoint. The endpoint's FIFO can also be configured to use double-packet or single-packet buffering. When double-packet buffering is enabled, two data packets can be buffered in the FIFO, which also requires that the FIFO is at least two packets in size. When double-packet buffering is disabled, only one packet can be buffered, even if the packet size is less than half the FIFO size.

**Note:** The maximum packet size set for any endpoint must not exceed the FIFO size. The **USBTXMAXPn** register should not be written to while data is in the FIFO as unexpected results may occur.

#### *Single-Packet Buffering*

If the size of the transmit endpoint's FIFO is less than twice the maximum packet size for this endpoint (as set in the **USB Transmit Dynamic FIFO Sizing (USBTXFIFOSZ)** register), only one packet can be buffered in the FIFO and single-packet buffering is required. When each packet is completely loaded into the transmit FIFO, the TXRDY bit in the **USB Transmit Control and Status Endpoint n Low (USBTXC SRLn)** register must be set. If the AUTOSET bit in the **USB Transmit Control and Status Endpoint n High (USBTXC SRHn)** register is set, the TXRDY bit is automatically set when a maximum-sized packet is loaded into the FIFO. For packet sizes less than the maximum, the

TXRDY bit must be set manually. When the TXRDY bit is set, either manually or automatically, the packet is ready to be sent. When the packet has been successfully sent, both TXRDY and FIFONE are cleared, and the appropriate transmit endpoint interrupt signaled. At this point, the next packet can be loaded into the FIFO.

### **Double-Packet Buffering**

If the size of the transmit endpoint's FIFO is at least twice the maximum packet size for this endpoint, two packets can be buffered in the FIFO and double-packet buffering is allowed. As each packet is loaded into the transmit FIFO, the TXRDY bit in the **USBTXCSRLn** register must be set. If the AUTOSET bit in the **USBTXCSRHn** register is set, the TXRDY bit is automatically set when a maximum-sized packet is loaded into the FIFO. For packet sizes less than the maximum, TXRDY must be set manually. When the TXRDY bit is set, either manually or automatically, the packet is ready to be sent. After the first packet is loaded, TXRDY is immediately cleared and an interrupt is generated. A second packet can now be loaded into the transmit FIFO and TXRDY set again (either manually or automatically if the packet is the maximum size). At this point, both packets are ready to be sent. After each packet has been successfully sent, TXRDY is automatically cleared and the appropriate transmit endpoint interrupt signaled to indicate that another packet can now be loaded into the transmit FIFO. The state of the FIFONE bit in the **USBTXCSRLn** register at this point indicates how many packets may be loaded. If the FIFONE bit is set, then another packet is in the FIFO and only one more packet can be loaded. If the FIFONE bit is clear, then no packets are in the FIFO and two more packets can be loaded.

**Note:** Double-packet buffering is disabled if an endpoint's corresponding EPn bit is set in the **USB Transmit Double Packet Buffer Disable (USBTXDPKTBUFFDIS)** register. This bit is set by default, so it must be cleared to enable double-packet buffering.

### **19.3.1.3 OUT Transactions**

OUT transactions are handled through the USB controller receive FIFOs. The sizes of the receive FIFOs for the 15 configurable OUT endpoints are determined by the **USB Receive FIFO Start Address (USBRXFIFOADD)** register. The maximum amount of data received by an endpoint in any packet is determined by the value written to the **USB Maximum Receive Data Endpoint n (USBRXMAXPn)** register for that endpoint. When double-packet buffering is enabled, two data packets can be buffered in the FIFO. When double-packet buffering is disabled, only one packet can be buffered even if the packet is less than half the FIFO size.

**Note:** In all cases, the maximum packet size must not exceed the FIFO size.

### **Single-Packet Buffering**

If the size of the receive endpoint FIFO is less than twice the maximum packet size for an endpoint, only one data packet can be buffered in the FIFO and single-packet buffering is required. When a packet is received and placed in the receive FIFO, the RXRDY and FULL bits in the **USB Receive Control and Status Endpoint n Low (USBRXCSRLn)** register are set and the appropriate receive endpoint is signaled, indicating that a packet can now be unloaded from the FIFO. After the packet has been unloaded, the RXRDY bit must be cleared in order to allow further packets to be received. This action also generates the acknowledge signaling to the Host controller. If the AUTOCL bit in the **USB Receive Control and Status Endpoint n High (USBRXCSRHn)** register is set and a maximum-sized packet is unloaded from the FIFO, the RXRDY and FULL bits are cleared automatically. For packet sizes less than the maximum, RXRDY must be cleared manually.

### **Double-Packet Buffering**

If the size of the receive endpoint FIFO is at least twice the maximum packet size for the endpoint, two data packets can be buffered and double-packet buffering can be used. When the first packet

is received and loaded into the receive FIFO, the RXRDY bit in the **USBRXCSRLn** register is set and the appropriate receive endpoint interrupt is signaled to indicate that a packet can now be unloaded from the FIFO.

**Note:** The FULL bit in **USBRXCSRLn** is not set when the first packet is received. It is only set if a second packet is received and loaded into the receive FIFO.

After each packet has been unloaded, the RXRDY bit must be cleared to allow further packets to be received. If the AUTOCL bit in the **USBRXCSRHn** register is set and a maximum-sized packet is unloaded from the FIFO, the RXRDY bit is cleared automatically. For packet sizes less than the maximum, RXRDY must be cleared manually. If the FULL bit is set when RXRDY is cleared, the USB controller first clears the FULL bit, then sets RXRDY again to indicate that there is another packet waiting in the FIFO to be unloaded.

**Note:** Double-packet buffering is disabled if an endpoint's corresponding EPn bit is set in the **USB Receive Double Packet Buffer Disable (USBXDPKTBUFDIS)** register. This bit is set by default, so it must be cleared to enable double-packet buffering.

#### 19.3.1.4 Scheduling

The Device has no control over the scheduling of transactions as scheduling is determined by the Host controller. The Stellaris USB controller can set up a transaction at any time. The USB controller waits for the request from the Host controller and generates an interrupt when the transaction is complete or if it was terminated due to some error. If the Host controller makes a request and the Device controller is not ready, the USB controller sends a busy response (NAK) to all requests until it is ready.

#### 19.3.1.5 Additional Actions

The USB controller responds automatically to certain conditions on the USB bus or actions by the Host controller such as when the USB controller automatically stalls a control transfer or unexpected zero length OUT data packets.

##### ***Stalled Control Transfer***

The USB controller automatically issues a STALL handshake to a control transfer under the following conditions:

1. The Host sends more data during an OUT data phase of a control transfer than was specified in the Device request during the SETUP phase. This condition is detected by the USB controller when the Host sends an OUT token (instead of an IN token) after the last OUT packet has been unloaded and the DATAEND bit in the **USB Control and Status Endpoint 0 Low (USBCSRL0)** register has been set.
2. The Host requests more data during an IN data phase of a control transfer than was specified in the Device request during the SETUP phase. This condition is detected by the USB controller when the Host sends an IN token (instead of an OUT token) after the CPU has cleared TXRDY and set DATAEND in response to the ACK issued by the Host to what should have been the last packet.
3. The Host sends more than **USBRXMAXPn** bytes of data with an OUT data token.
4. The Host sends more than a zero length data packet for the OUT STATUS phase.

### Zero Length OUT Data Packets

A zero-length OUT data packet is used to indicate the end of a control transfer. In normal operation, such packets should only be received after the entire length of the Device request has been transferred.

However, if the Host sends a zero-length OUT data packet before the entire length of Device request has been transferred, it is signaling the premature end of the transfer. In this case, the USB controller automatically flushes any IN token ready for the data phase from the FIFO and sets the DATAEND bit in the **USBCSRL0** register.

### Setting the Device Address

When a Host is attempting to enumerate the USB Device, it requests that the Device change its address from zero to some other value. The address is changed by writing the value that the Host requested to the **USB Device Functional Address (USBFADDR)** register. However, care should be taken when writing to **USBFADDR** to avoid changing the address before the transaction is complete. This register should only be set after the SET\_ADDRESS command is complete. Like all control transactions, the transaction is only complete after the Device has left the STATUS phase. In the case of a SET\_ADDRESS command, the transaction is completed by responding to the IN request from the Host with a zero-byte packet. Once the Device has responded to the IN request, the **USBFADDR** register should be programmed to the new value as soon as possible to avoid missing any new commands sent to the new address.

**Note:** If the **USBFADDR** register is set to the new value as soon as the Device receives the OUT transaction with the SET\_ADDRESS command in the packet, it changes the address during the control transfer. In this case, the Device does not receive the IN request that allows the USB transaction to exit the STATUS phase of the control transfer because it is sent to the old address. As a result, the Host does not get a response to the IN request, and the Host fails to enumerate the Device.

## 19.3.1.6 SUSPEND

When no activity has occurred on the USB bus for 3 ms, the USB controller automatically enters SUSPEND mode. If the SUSPEND interrupt has been enabled in the **USB Interrupt Enable (USBIE)** register, an interrupt is generated at this time. When in SUSPEND mode, the PHY also goes into SUSPEND mode. When RESUME signaling is detected, the USB controller exits SUSPEND mode and takes the PHY out of SUSPEND. If the RESUME interrupt is enabled, an interrupt is generated. The USB controller can also be forced to exit SUSPEND mode by setting the RESUME bit in the **USB Power (USBPOWER)** register. When this bit is set, the USB controller exits SUSPEND mode and drives RESUME signaling onto the bus. The RESUME bit must be cleared after 10 ms (a maximum of 15 ms) to end RESUME signaling.

To meet USB power requirements, the controller can be put into Deep Sleep mode which keeps the controller in a static state. The USB controller is not able to Hibernate because all the internal states are lost as a result.

## 19.3.1.7 Start-of-Frame

When the USB controller is operating in Device mode, it receives a Start-Of-Frame (SOF) packet from the Host once every millisecond. When the SOF packet is received, the 11-bit frame number contained in the packet is written into the **USB Frame Value (USBFRAME)** register, and an SOF interrupt is also signaled and can be handled by the application. Once the USB controller has started to receive SOF packets, it expects one every millisecond. If no SOF packet is received after 1.00358 ms, the packet is assumed to have been lost, and the **USBFRAME** register is not updated. The

USB controller continues and resynchronizes these pulses to the received SOF packets when these packets are successfully received again.

#### 19.3.1.8 USB RESET

When a RESET condition is detected on the USB bus, the USB controller automatically performs the following actions:

- Clears the **USBFADDR** register.
- Clears the **USB Endpoint Index (USBEPIDX)** register.
- Flushes all endpoint FIFOs.
- Clears all control/status registers.
- Enables all endpoint interrupts.
- Generates a RESET interrupt.

When the application software driving the USB controller receives a RESET interrupt, any open pipes are closed and the USB controller waits for bus enumeration to begin.

#### 19.3.1.9 Connect/Disconnect

The USB controller connection to the USB bus is handled by software. The USB PHY can be switched between normal mode and non-driving mode by setting or clearing the SOFTCONN bit of the **USBPOWER** register. When the SOFTCONN bit is set, the PHY is placed in its normal mode, and the USB0DP/USB0DM lines of the USB bus are enabled. At the same time, the USB controller is placed into a state, in which it does not respond to any USB signaling except a USB RESET.

When the SOFTCONN bit is cleared, the PHY is put into non-driving mode, USB0DP and USB0DM are tristated, and the USB controller appears to other devices on the USB bus as if it has been disconnected. The non-driving mode is the default so the USB controller appears disconnected until the SOFTCONN bit has been set. The application software can then choose when to set the PHY into its normal mode. Systems with a lengthy initialization procedure may use this to ensure that initialization is complete, and the system is ready to perform enumeration before connecting to the USB bus. Once the SOFTCONN bit has been set, the USB controller can be disconnected by clearing this bit.

**Note:** The USB controller does not generate an interrupt when the Device is connected to the Host. However, an interrupt is generated when the Host terminates a session.

### 19.3.2 DMA Operation

The USB peripheral provides an interface connected to the  $\mu$ DMA controller with separate channels for 3 transmit endpoints and 3 receive endpoints. Software selects which endpoints to service with the  $\mu$ DMA channels using the **USB DMA Select (USBDMASEL)** register. The  $\mu$ DMA operation of the USB is enabled through the **USBTXCSRHn** and **USBRXCSRHn** registers, for the TX and RX channels respectively. When  $\mu$ DMA operation is enabled, the USB asserts a  $\mu$ DMA request on the enabled receive or transmit channel when the associated FIFO can transfer data. When either FIFO can transfer data, the burst request for that channel is asserted. The  $\mu$ DMA channel must be configured to operate in Basic mode, and the size of the  $\mu$ DMA transfer must be restricted to whole multiples of the size of the USB FIFO. Both read and write transfers of the USB FIFOs using  $\mu$ DMA must be configured in this manner. For example, if the USB endpoint is configured with a FIFO size of 64 bytes, the  $\mu$ DMA channel can be used to transfer 64 bytes to or from the endpoint FIFO. If the

number of bytes to transfer is less than 64, then a programmed I/O method must be used to copy the data to or from the FIFO.

If the DMAMOD bit in the **USBTXCSRn/USBRXCSRn** register is clear, an interrupt is generated after every packet is transferred, but the  $\mu$ DMA continues transferring data. If the DMAMOD bit is set, an interrupt is generated only when the entire  $\mu$ DMA transfer is complete. The interrupt occurs on the USB interrupt vector. Therefore, if interrupts are used for USB operation and the  $\mu$ DMA is enabled, the USB interrupt handler must be designed to handle the  $\mu$ DMA completion interrupt.

Care must be taken when using the  $\mu$ DMA to unload the receive FIFO as data is read from the receive FIFO in 4 byte chunks regardless of value of the MAXLOAD field in the **USBRXCSRn** register. The RXRDY bit is cleared as follows.

**Table 19-3. Remainder (MAXLOAD/4)**

| Value | Description        |
|-------|--------------------|
| 0     | MAXLOAD = 64 bytes |
| 1     | MAXLOAD = 61 bytes |
| 2     | MAXLOAD = 62 bytes |
| 3     | MAXLOAD = 63 bytes |

**Table 19-4. Actual Bytes Read**

| Value | Description |
|-------|-------------|
| 0     | MAXLOAD     |
| 1     | MAXLOAD+3   |
| 2     | MAXLOAD+2   |
| 3     | MAXLOAD+1   |

**Table 19-5. Packet Sizes That Clear RXRDY**

| Value | Description                              |
|-------|------------------------------------------|
| 0     | MAXLOAD, MAXLOAD-1, MAXLOAD-2, MAXLOAD-3 |
| 1     | MAXLOAD                                  |
| 2     | MAXLOAD, MAXLOAD-1                       |
| 3     | MAXLOAD, MAXLOAD-1, MAXLOAD-2            |

To enable DMA operation for the endpoint receive channel, the DMAEN bit of the **USBRXCSRn** register should be set. To enable DMA operation for the endpoint transmit channel, the DMAEN bit of the **USBTXCSRn** register must be set.

See “Micro Direct Memory Access ( $\mu$ DMA)” on page 365 for more details about programming the  $\mu$ DMA controller.

## 19.4 Initialization and Configuration

To use the USB Controller, the peripheral clock must be enabled via the **RCGC2** register (see page 288).

The initial configuration in all cases requires that the processor enable the USB controller and USB controller’s physical layer interface (PHY) before setting any registers. The next step is to enable the USB PLL so that the correct clocking is provided to the PHY.

The USB controller provides a method to set the current operating mode of the USB controller. This register should be written with the desired default mode so that the controller can respond to external USB events.

### 19.4.1 Endpoint Configuration

To start communication, the endpoint registers must first be configured. An endpoint must be configured before enumerating to the Host controller.

The endpoint 0 configuration is limited because it is a fixed-function, fixed-FIFO-size endpoint. The endpoint requires little setup but does require a software-based state machine to progress through the setup, data, and status phases of a standard control transaction. The configuration of the remaining endpoints is done once before enumerating and then only changed if an alternate configuration is selected by the Host controller. Once the type of endpoint is configured, a FIFO area must be assigned to each endpoint. In the case of bulk, control and interrupt endpoints, each has a maximum of 64 bytes per transaction. Isochronous endpoints can have packets with up to 1023 bytes per packet. In either mode, the maximum packet size for the given endpoint must be set prior to sending or receiving data.

Configuring each endpoint's FIFO involves reserving a portion of the overall USB FIFO RAM to each endpoint. The total FIFO RAM available is 4 Kbytes with the first 64 bytes reserved for endpoint 0. The endpoint's FIFO must be at least as large as the maximum packet size. The FIFO can also be configured as a double-buffered FIFO so that interrupts occur at the end of each packet and allow filling the other half of the FIFO.

The USB Device controller's soft connect must be enabled when the Device is ready to start communications, indicating to the Host controller that the Device is ready to start the enumeration process.

## 19.5 Register Map

Table 19-6 on page 938 lists the registers. All addresses given are relative to the USB base address of 0x4005.0000. Note that the USB controller clock must be enabled before the registers can be programmed (see page 288). There must be a delay of 3 system clocks after the USB module clock is enabled before any USB module registers are accessed.

**Table 19-6. Universal Serial Bus (USB) Controller Register Map**

| Offset | Name     | Type | Reset  | Description                   | See page |
|--------|----------|------|--------|-------------------------------|----------|
| 0x000  | USBFADDR | R/W  | 0x00   | USB Device Functional Address | 944      |

## 19.6 Register Descriptions

The LM3S5R31 USB controller has Device only capabilities as specified in the USB0 bit field in the **DC6** register (see page 257).

Register 1: USB Device Functional Address (USBFADDR), offset 0x000

USBFADDR is an 8-bit register that contains the 7-bit address of the Device part of the transaction. This register must be written with the address received through a SET\_ADDRESS command, which is then used for decoding the function address in subsequent token packets.

**Important:** See the section called “Setting the Device Address” on page 935 for special considerations when writing this register.

USB Device Functional Address (USBFADDR)

Base 0x4005.0000  
Offset 0x000  
Type R/W, reset 0x00

| Bit/Field | Name     | Type | Reset | Description                                                                                                                                                                                   |
|-----------|----------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7         | reserved | RO   | 0     | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation. |
| 6:0       | FUNCADDR | R/W  | 0x00  | Function Address<br>Function Address of Device as received through SET_ADDRESS.                                                                                                               |

## Register 2: USB Power (USBPOWER), offset 0x001

**USBPOWER** is an 8-bit register used for controlling SUSPEND and RESUME signaling and some basic operational aspects of the USB controller.

### USB Power (USBPOWER)

Base 0x4005.0000

### Register 3: USB Transmit Interrupt Status (USBTXIS), offset 0x002

**Important:** This register is read-sensitive. See the register description for details.

**USBTXIS** is a 16-bit read-only register that indicates which interrupts are currently active for endpoint 0 and the transmit endpoints 1–15. The meaning of the EPn bits in this register is based on the mode of the device. The EP1 through EP15 bits always indicate that the USB controller is sending data; however, the bits refer to IN endpoints. The EP0 bit is special and indicates that either a control IN or control OUT endpoint has generated an interrupt.

**Note:** Bits relating to endpoints that have not been configured always return 0. Note also that all active interrupts are cleared when this register is read.

**Register 5: USB Transmit Interrupt Enable (USBTXIE), offset 0x006**

**USBTXIE** is a 16-bit register that provides interrupt enable bits for the interrupts in the **USBTXIS** register. When a bit is set, the USB interrupt is asserted to the interrupt controller when the corresponding interrupt bit in the **USBTXIS** register is set. When a bit is cleared, the interrupt in the **USBTXIS** register is still set but the USB interrupt to the interrupt controller is not asserted. On reset, all interrupts are enabled.

|           |      |      |       | Value Description                                                                                          |
|           |      |      |       | 1 An interrupt is sent to the interrupt controller when the EP0 bit in the <b>USBTXIS</b> register is set. |
|           |      |      |       | 0 The EP0 transmit and receive interrupt is suppressed and not sent to the interrupt controller.           |

**Register 6: USB Receive Interrupt Enable (USBRXIE), offset 0x008**

**USBRXIE** is a 16-bit register that provides interrupt enable bits for the interrupts in the **USBRXIS** register. When a bit is set, the USB interrupt is asserted to the interrupt controller when the corresponding interrupt bit in the **USBRXIS** register is set. When a bit is cleared, the interrupt in the **USBRXIS** register is still set but the USB interrupt to the interrupt controller is not asserted. On reset, all interrupts are enabled.

**USB Receive Interrupt Enable (USBRXIE)**

## Register 7: USB General Interrupt Status (USBIS), offset 0x00A

**Important:** This register is read-sensitive. See the register description for details.

**USBIS** is an 8-bit read-only register that indicates which USB interrupts are currently active. All active interrupts are cleared when this register is read.

### USB General Interrupt Status (USBIS)

Register 9: USB Frame Value (USBFRAME), offset 0x00C

USBFRAME is a 16-bit read-only register that holds the last received frame number.

USB Frame Value (USBFRAME)

Base 0x4005.0000  
Offset 0x00C  
Type RO, reset 0x0000

Register 10: USB Endpoint Index (USBEPIDX), offset 0x00E

Each endpoint's buffer can be accessed by configuring a FIFO size and starting address. The **USBEPIDX** 8-bit register is used with the **USBTXFIFOSZ**, **USBRXFIFOSZ**, **USBTXFIFOADD**, and **USBRXFIFOADD** registers.

| 3:0       | EPIDX    | R/W  | 0x0   | Endpoint Index<br>This bit field configures which endpoint is accessed when reading or writing to one of the USB controller's indexed registers. A value of 0x0 corresponds to Endpoint 0 and a value of 0xF corresponds to Endpoint 15. |

**Register 11: USB Test Mode (USBTEST), offset 0x00F**

**USBTEST** is an 8-bit register that is primarily used to put the USB controller into one of the four test modes for operation described in the *USB 2.0 Specification*, in response to a SET FEATURE: USBTESTMODE command. This register is not used in normal operation.

**Note:** Only one of these bits should be set at any time.

**USB Test Mode (USBTEST)**

---

**Important:** This register is read-sensitive. See the register description for details.

---

These 32-bit registers provide an address for CPU access to the FIFOs for each endpoint. Writing to these addresses loads data into the Transmit FIFO for the corresponding endpoint. Reading from these addresses unloads data from the Receive FIFO for the corresponding endpoint.

Transfers to and from FIFOs may be 8-bit, 16-bit or 32-bit as required, and any combination of accesses is allowed provided the data accessed is contiguous. All transfers associated with one packet must be of the same width so that the data is consistently byte-, halfword- or word-aligned. However, the last transfer may contain fewer bytes than the previous transfers in order to complete an odd-byte or odd-word transfer.

Depending on the size of the FIFO and the expected maximum packet size, the FIFOs support either single-packet or double-packet buffering (see the section called “Single-Packet Buffering” on page 933). Burst writing of multiple packets is not supported as flags must be set after each packet is written.

Following a STALL response or a transmit error on endpoint 1–15, the associated FIFO is completely flushed.

Register 28: USB Transmit Dynamic FIFO Sizing (USBTXFIFOSZ), offset 0x062

Register 29: USB Receive Dynamic FIFO Sizing (USBRXFIFOSZ), offset 0x063

These 8-bit registers allow the selected TX/RX endpoint FIFOs to be dynamically sized. USBEPIDX is used to configure each transmit endpoint's FIFO size.

Register 30: USB Transmit FIFO Start Address (USBTXFIFOADD), offset 0x064

Register 31: USB Receive FIFO Start Address (USBRXFIFOADD), offset 0x066

USBTXFIFOADD and USBRXFIFOADD are 16-bit registers that control the start address of the selected transmit and receive endpoint FIFOs.

**Register 48: USB Maximum Transmit Data Endpoint 14 (USBTXMAXP14), offset 0x1E0**

**Register 49: USB Maximum Transmit Data Endpoint 15 (USBTXMAXP15), offset 0x1F0**

The **USBTXMAXPn** 16-bit register defines the maximum amount of data that can be transferred through the transmit endpoint in a single operation.

Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the *USB Specification* on packet sizes for bulk, interrupt and isochronous transfers in full-speed operation.

The total amount of data represented by the value written to this register must not exceed the FIFO size for the transmit endpoint, and must not exceed half the FIFO size if double-buffering is required.

If this register is changed after packets have been sent from the endpoint, the transmit endpoint FIFO must be completely flushed (using the FLUSH bit in **USBTXCSSLn**) after writing the new value to this register.

**Note:** **USBTXMAXPn** must be set to an even number of bytes for proper interrupt generation in  $\mu$ DMA Basic Mode.

|-----------|----------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:1       | reserved | RO   | 0x00  | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation. |
| 0         | FLUSH    | R/W  | 0     | Flush FIFO                                                                                                                                                                                    |

#### Value Description

|   |                                                                                                                                        |
|---|----------------------------------------------------------------------------------------------------------------------------------------|
| 0 | No effect.                                                                                                                             |
| 1 | Flushes the next packet to be transmitted/read from the endpoint 0 FIFO. The FIFO pointer is reset and the TXRDY/RXRDY bit is cleared. |

This bit is automatically cleared after the flush is performed.

**Important:** This bit should only be set when TXRDY/RXRDY is set. At other times, it may cause data to be corrupted.

Register 52: USB Receive Byte Count Endpoint 0 (USBCOUNT0), offset 0x108

**USBCOUNT0** is an 8-bit read-only register that indicates the number of received data bytes in the endpoint 0 FIFO. The value returned changes as the contents of the FIFO change and is only valid while the RXRDY bit is set.

USB Receive Byte Count Endpoint 0 (USBCOUNT0)

Base 0x4005.0000  
Offset 0x108  
Type RO, reset 0x00

| Bit/Field | Name     | Type | Reset | Description                                                                                                                                                                                   |

**Register 97: USB Maximum Receive Data Endpoint 15 (USBRXMAXP15), offset 0x1F4**

The **USBRXMAXPn** is a 16-bit register which defines the maximum amount of data that can be transferred through the selected receive endpoint in a single operation.

Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the *USB Specification* on packet sizes for bulk, interrupt and isochronous transfers in full-speed operations.

The total amount of data represented by the value written to this register must not exceed the FIFO size for the receive endpoint, and must not exceed half the FIFO size if double-buffering is required.

**Note:** **USBRXMAXPn** must be set to an even number of bytes for proper interrupt generation in  $\mu$ DMA Basic mode.

|           |                  |      |       | 1 Enables the RXRDY bit to be automatically cleared when a packet of <b>USBXMAXPn</b> bytes has been unloaded from the receive FIFO. When packets of less than the maximum packet size are unloaded, RXRDY must be cleared manually. Care must be taken when using $\mu$ DMA to unload the receive FIFO as data is read from the receive FIFO in 4 byte chunks regardless of the value of the MAXLOAD field in the <b>USBXMAXPn</b> register, see "DMA Operation" on page 936. |
| 6         | ISO              | R/W  | 0     | Isochronous Transfers                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Register 138: USB Receive Byte Count Endpoint 11 (USBRXCOUNT11), offset 0x1B8**

**Register 139: USB Receive Byte Count Endpoint 12 (USBRXCOUNT12), offset 0x1C8**

**Register 140: USB Receive Byte Count Endpoint 13 (USBRXCOUNT13), offset 0x1D8**

**Register 141: USB Receive Byte Count Endpoint 14 (USBRXCOUNT14), offset 0x1E8**

**Register 142: USB Receive Byte Count Endpoint 15 (USBRXCOUNT15), offset 0x1F8**

**Note:** The value returned changes as the FIFO is unloaded and is only valid while the RXRDY bit in the **USBXCSRLn** register is set.

**USBXCOUNTn** is a 16-bit read-only register that holds the number of data bytes in the packet currently in line to be read from the receive FIFO. If the packet is transmitted as multiple bulk packets, the number given is for the combined packet.

USB Receive Byte Count Endpoint 1 (USBRXCOUNT1)

Base 0x4005.0000  
Offset 0x118

#### Value Description

|   |                                    |
|---|------------------------------------|
| 1 | A RESUME status has been detected. |
| 0 | An interrupt has not occurred.     |

This bit is cleared by writing a 1 to the RESUME bit in the **USBDRISC** register.

**Register 146: USB Device RESUME Interrupt Mask (USBDRIM), offset 0x414**

The **USBDRIM** 32-bit register is the masked interrupt status register. On a read, this register gives the current masked status value of the corresponding interrupt. A write has no effect.

#### Value Description

- |   |                                                                                                                                   |
|---|-----------------------------------------------------------------------------------------------------------------------------------|
| 1 | The RESUME bits in the <b>USBDRRIS</b> and <b>USBDRCIM</b> registers are set, providing an interrupt to the interrupt controller. |
| 0 | No interrupt has occurred or the interrupt is masked.                                                                             |

This bit is cleared by writing a 1. Clearing this bit also clears the RESUME bit in the **USBDRCRIS** register.

**Register 148: USB DMA Select (USBDMASEL), offset 0x450**

This 32-bit register specifies which endpoints are mapped to the 6 allocated  $\mu$ DMA channels, see Table 8-1 on page 367 for more information on channel assignments.

**USB DMA Select (USBDMASEL)**

Base 0x4005.0000

Offset 0x450

Type R/W, reset 0x0033.2211

## 20 Analog Comparators

An analog comparator is a peripheral that compares two analog voltages and provides a logical output that signals the comparison result.

**Note:** Not all comparators have the option to drive an output pin. See “Signal Description” on page 1001 for more information.

The comparator can provide its output to a device pin, acting as a replacement for an analog comparator on the board. In addition, the comparator can signal the application via interrupts or trigger the start of a sample sequence in the ADC. The interrupt generation and ADC triggering logic is separate and independent. This flexibility means, for example, that an interrupt can be generated on a rising edge and the ADC triggered on a falling edge.

The Stellaris® LM3S5R31 microcontroller provides two independent integrated analog comparators with the following functions:

- Compare external pin input to external pin input or to internal programmable voltage reference
- Compare a test voltage against any one of the following voltages:
  - An individual external reference voltage
  - A shared single external reference voltage
  - A shared internal reference voltage

### 20.1 Block Diagram

**Figure 20-1. Analog Comparator Module Block Diagram**

## 20.2 Signal Description

The following table lists the external signals of the Analog Comparators and describes the function of each. The Analog Comparator output signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the Analog Comparator signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 447) should be set to choose the Analog Comparator function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 465) to assign the Analog Comparator signal to the specified GPIO port pin. The positive and negative input signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 423.

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 20.3 Functional Description

The comparator compares the VIN- and VIN+ inputs to produce an output, VOUT.

$$VIN- < VIN+, VOUT = 1$$

$$VIN- > VIN+, VOUT = 0$$

As shown in Figure 20-2 on page 1002, the input source for VIN- is an external input, Cn-. In addition to an external input, Cn+, input sources for VIN+ can be the C0+ or an internal reference, V<sub>IREF</sub>.

**Figure 20-2. Structure of Comparator Unit**

A comparator is configured through two status/control registers, **Analog Comparator Control (ACCTL)** and **Analog Comparator Status (ACSTAT)**. The internal reference is configured through one control register, **Analog Comparator Reference Voltage Control (ACREFCTL)**. Interrupt status and control are configured through three registers, **Analog Comparator Masked Interrupt Status (ACMIS)**, **Analog Comparator Raw Interrupt Status (ACRIS)**, and **Analog Comparator Interrupt Enable (ACINTEN)**.

Typically, the comparator output is used internally to generate an interrupt as controlled by the ISEN bit in the **ACCTL** register. The output may also be used to drive an external pin, Co or generate an analog-to-digital converter (ADC) trigger.

**Important:** The ASRCP bits in the **ACCTL** register must be set before using the analog comparators.

### 20.3.1 Internal Reference Programming

The structure of the internal reference is shown in Figure 20-3 on page 1003. The internal reference is controlled by a single configuration register (**ACREFCTL**). Table 20-3 on page 1003 shows the programming options to develop specific internal reference values, to compare an external voltage against a particular voltage generated internally (V<sub>IREF</sub>).

Figure 20-3. Comparator Internal Reference Structure

Table 20-3. Internal Reference Voltage and ACREFCTL Field Values

| ACREFCTL Register |               | Output Reference Voltage Based on VREF Field Value                                                                                                                                                                                                       |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EN Bit Value      | RNG Bit Value |                                                                                                                                                                                                                                                          |
| EN=0              | RNG=X         | 0 V (GND) for any value of VREF; however, it is recommended that RNG=1 and VREF=0 for the least noisy ground reference.                                                                                                                                  |
| EN=1              | RNG=0         | <p>Total resistance in ladder is 31 R.</p> $V_{IREF} = V_{DDA} \times \frac{R_{VREF}}{R_T}$ $V_{IREF} = V_{DDA} \times \frac{(VREF + 8)}{31}$ $V_{IREF} = 0.85 + 0.106 \times VREF$ <p>The range of internal reference in this mode is 0.85-2.448 V.</p> |
|                   | RNG=1         | <p>Total resistance in ladder is 23 R.</p> $V_{IREF} = V_{DDA} \times \frac{R_{VREF}}{R_T}$ $V_{IREF} = V_{DDA} \times \frac{VREF}{23}$ $V_{IREF} = 0.143 \times VREF$ <p>The range of internal reference for this mode is 0-2.152 V.</p>                |

## 20.4 Initialization and Configuration

The following example shows how to configure an analog comparator to read back its output value from an internal register.

1. Enable the analog comparator clock by writing a value of 0x0010.0000 to the **RCGC1** register in the System Control module (see page 276).
2. Enable the clock to the appropriate GPIO modules via the **RCGC2** register (see page 288). To find out which GPIO ports to enable, refer to Table 24-5 on page 1147.
3. In the GPIO module, enable the GPIO port/pin associated with the input signals as GPIO inputs. To determine which GPIO to configure, see Table 24-4 on page 1138.
4. Configure the PMCN fields in the **GPIOCTL** register to assign the analog comparator output signals to the appropriate pins (see page 465 and Table 24-5 on page 1147).
5. Configure the internal voltage reference to 1.65 V by writing the **ACREFCTL** register with the value 0x0000.030C.
6. Configure the comparator to use the internal voltage reference and to *not* invert the output by writing the **ACCTLn** register with the value of 0x0000.040C.
7. Delay for 10  $\mu$ s.
8. Read the comparator output value by reading the **ACSTATn** register's OVAL value.

Change the level of the comparator negative input signal C - to see the OVAL value change.

## 20.5 Register Map

Table 20-4 on page 1004 lists the comparator registers. The offset listed is a hexadecimal increment to the register's address, relative to the Analog Comparator base address of 0x4003.C000. Note that the analog comparator clock must be enabled before the registers can be programmed (see page 276). There must be a delay of 3 system clocks after the analog comparator module clock is enabled before any analog comparator module registers are accessed.

**Table 20-4. Analog Comparators Register Map**

| Offset | Name     | Type  | Reset       | Description                                 | See page |
|--------|----------|-------|-------------|---------------------------------------------|----------|
| 0x000  | ACMIS    | R/W1C | 0x0000.0000 | Analog Comparator Masked Interrupt Status   | 1006     |
| 0x004  | ACRIS    | RO    | 0x0000.0000 | Analog Comparator Raw Interrupt Status      | 1007     |
| 0x008  | ACINTEN  | R/W   | 0x0000.0000 | Analog Comparator Interrupt Enable          | 1008     |
| 0x010  | ACREFCTL | R/W   | 0x0000.0000 | Analog Comparator Reference Voltage Control | 1009     |
| 0x020  | ACSTAT0  | RO    | 0x0000.0000 | Analog Comparator Status 0                  | 1010     |
| 0x024  | ACCTL0   | R/W   | 0x0000.0000 | Analog Comparator Control 0                 | 1011     |
| 0x040  | ACSTAT1  | RO    | 0x0000.0000 | Analog Comparator Status 1                  | 1010     |
| 0x044  | ACCTL1   | R/W   | 0x0000.0000 | Analog Comparator Control 1                 | 1011     |

## 20.6 Register Descriptions

The remainder of this section lists and describes the Analog Comparator registers, in numerical order by address offset.

## Register 1: Analog Comparator Masked Interrupt Status (ACMIS), offset 0x000

This register provides a summary of the interrupt status (masked) of the comparators.

### Analog Comparator Masked Interrupt Status (ACMIS)

Base 0x4003.C000

Offset 0x000

Type R/W1C, reset 0x0000.0000

**Register 2: Analog Comparator Raw Interrupt Status (ACRIS), offset 0x004**

This register provides a summary of the interrupt status (raw) of the comparators. The bits in this register must be enabled to generate interrupts using the **ACINTEN** register.

| 0         | reserved                                                                       | RO   | 0     | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.                                                                                                                                                                                                            |       |             |     |                                                            |     |                                                                                |     |             |     |             |

## 21 Pulse Width Modulator (PWM)

Pulse width modulation (PWM) is a powerful technique for digitally encoding analog signal levels. High-resolution counters are used to generate a square wave, and the duty cycle of the square wave is modulated to encode an analog signal. Typical applications include switching power supplies and motor control.

The Stellaris® microcontroller contains one PWM module, with four PWM generator blocks and a control block, for a total of 8 PWM outputs. The control block determines the polarity of the PWM signals, and which signals are passed through to the pins.

Each PWM generator block produces two PWM signals that share the same timer and frequency and can either be programmed with independent actions or as a single pair of complementary signals with dead-band delays inserted. The output signals, `pwmA'` and `pwmB'`, of the PWM generation blocks are managed by the output control block before being passed to the device pins as `PWM0` and `PWM1` or `PWM2` and `PWM3`, and so on.

The Stellaris PWM module provides a great deal of flexibility and can generate simple PWM signals, such as those required by a simple charge pump as well as paired PWM signals with dead-band delays, such as those required by a half-H bridge driver. Three generator blocks can also generate the full six channels of gate controls required by a 3-phase inverter bridge.

Each PWM generator block has the following features:

- Four fault-condition handling inputs to quickly provide low-latency shutdown and prevent damage to the motor being controlled
- One 16-bit counter
  - Runs in Down or Up/Down mode
  - Output frequency controlled by a 16-bit load value
  - Load value updates can be synchronized
  - Produces output signals at zero and load value
- Two PWM comparators
  - Comparator value updates can be synchronized
  - Produces output signals on match
- PWM signal generator
  - Output PWM signal is constructed based on actions taken as a result of the counter and PWM comparator output signals
  - Produces two independent PWM signals
- Dead-band generator
  - Produces two PWM signals with programmable dead-band delays suitable for driving a half-H bridge
  - Can be bypassed, leaving input PWM signals unmodified

- Can initiate an ADC sample sequence

The control block determines the polarity of the PWM signals and which signals are passed through to the pins. The output of the PWM generation blocks are managed by the output control block before being passed to the device pins. The PWM control block has the following options:

- PWM output enable of each PWM signal
- Optional output inversion of each PWM signal (polarity control)
- Optional fault handling for each PWM signal
- Synchronization of timers in the PWM generator blocks
- Synchronization of timer/comparator updates across the PWM generator blocks
- Synchronization of PWM output enables across the PWM generator blocks
- Interrupt status summary of the PWM generator blocks
- Extended PWM fault handling, with multiple fault signals, programmable polarities, and filtering
- PWM generators can be operated independently or synchronized with other generators

## **21.1 Block Diagram**

Figure 21-1 on page 1015 provides the Stellaris PWM module diagram and Figure 21-2 on page 1015 provides a more detailed diagram of a Stellaris PWM generator. The LM3S5R31 controller contains four generator blocks that generate eight independent PWM signals or four paired PWM signals with dead-band delays inserted.

## 21.2 Signal Description

The following table lists the external signals of the PWM module and describes the function of each. The PWM controller signals are alternate functions for some GPIO signals and default to be GPIO

signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these PWM signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 447) should be set to choose the PWM function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 465) to assign the PWM signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 423.

Table 21-1. Signals for PWM (100LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                          |
|----------|------------|--------------------------|----------|--------------------------|------------------------------------------------------|
| Fault0   | 6          | PE4 (4)                  | I        | TTL                      | PWM Fault 0.                                         |
|          | 16         | PG3 (8)                  |          |                          |                                                      |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 21.3 Functional Description

### 21.3.1 PWM Timer

The timer in each PWM generator runs in one of two modes: Count-Down mode or Count-Up/Down mode. In Count-Down mode, the timer counts from the load value to zero, goes back to the load value, and continues counting down. In Count-Up/Down mode, the timer counts from zero up to the load value, back down to zero, back up to the load value, and so on. Generally, Count-Down mode

is used for generating left- or right-aligned PWM signals, while the Count-Up/Down mode is used for generating center-aligned PWM signals.

The timers output three signals that are used in the PWM generation process: the direction signal (this is always Low in Count-Down mode, but alternates between Low and High in Count-Up/Down mode), a single-clock-cycle-width High pulse when the counter is zero, and a single-clock-cycle-width High pulse when the counter is equal to the load value. Note that in Count-Down mode, the zero pulse is immediately followed by the load pulse. In the figures in this chapter, these signals are labelled "dir," "zero," and "load."

### 21.3.2 PWM Comparators

Each PWM generator has two comparators that monitor the value of the counter; when either comparator matches the counter, they output a single-clock-cycle-width High pulse, labelled "cmpA" and "cmpB" in the figures in this chapter. When in Count-Up/Down mode, these comparators match both when counting up and when counting down, and thus are qualified by the counter direction signal. These qualified pulses are used in the PWM generation process. If either comparator match value is greater than the counter load value, then that comparator never outputs a High pulse.

Figure 21-3 on page 1020 shows the behavior of the counter and the relationship of these pulses when the counter is in Count-Down mode. Figure 21-4 on page 1020 shows the behavior of the counter and the relationship of these pulses when the counter is in Count-Up/Down mode. In these figures, the following definitions apply:

- LOAD is the value in the **PWMnLOAD** register
- COMPA is the value in the **PWMnCMPA** register
- COMPB is the value in the **PWMnCMPB** register
- 0 is the value zero
- load is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to the load value
- zero is the internal signal that has a single-clock-cycle-width High pulse when the counter is zero
- cmpA is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to COMPA
- cmpB is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to COMPB
- dir is the internal signal that indicates the count direction

**Figure 21-3. PWM Count-Down Mode****Figure 21-4. PWM Count-Up/Down Mode**

### 21.3.3 PWM Signal Generator

Each PWM generator takes the load, zero, cmpA, and cmpB pulses (qualified by the dir signal) and generates two internal PWM signals, pwmA and pwmB. In Count-Down mode, there are four events that can affect these signals: zero, load, match A down, and match B down. In Count-Up/Down mode, there are six events that can affect these signals: zero, load, match A down, match A up, match B down, and match B up. The match A or match B events are ignored when they coincide with the zero or load events. If the match A and match B events coincide, the first signal, pwmA, is generated based only on the match A event, and the second signal, pwmB, is generated based only on the match B event.

For each event, the effect on each output PWM signal is programmable: it can be left alone (ignoring the event), it can be toggled, it can be driven Low, or it can be driven High. These actions can be used to generate a pair of PWM signals of various positions and duty cycles, which do or do not overlap. Figure 21-5 on page 1021 shows the use of Count-Up/Down mode to generate a pair of

center-aligned, overlapped PWM signals that have different duty cycles. This figure shows the pwmA and pwmB signals before they have passed through the dead-band generator.

**Figure 21-5. PWM Generation Example In Count-Up/Down Mode**

In this example, the first generator is set to drive High on match A up, drive Low on match A down, and ignore the other four events. The second generator is set to drive High on match B up, drive Low on match B down, and ignore the other four events. Changing the value of comparator A changes the duty cycle of the pwmA signal, and changing the value of comparator B changes the duty cycle of the pwmB signal.

### 21.3.4 Dead-Band Generator

The pwmA and pwmB signals produced by each PWM generator are passed to the dead-band generator. If the dead-band generator is disabled, the PWM signals simply pass through to the pwmA' and pwmB' signals unmodified. If the dead-band generator is enabled, the pwmB signal is lost and two PWM signals are generated based on the pwmA signal. The first output PWM signal, pwmA' is the pwmA signal with the rising edge delayed by a programmable amount. The second output PWM signal, pwmB', is the inversion of the pwmA signal with a programmable delay added between the falling edge of the pwmA signal and the rising edge of the pwmB' signal.

The resulting signals are a pair of active High signals where one is always High, except for a programmable amount of time at transitions where both are Low. These signals are therefore suitable for driving a half-H bridge, with the dead-band delays preventing shoot-through current from damaging the power electronics. Figure 21-6 on page 1021 shows the effect of the dead-band generator on the pwmA signal and the resulting pwmA' and pwmB' signals that are transmitted to the output control block.

**Figure 21-6. PWM Dead-Band Generator**

### 21.3.5 Interrupt/ADC-Trigger Selector

Each PWM generator also takes the same four (or six) counter events and uses them to generate an interrupt or an ADC trigger. Any of these events or a set of these events can be selected as a source for an interrupt; when any of the selected events occur, an interrupt is generated. Additionally, the same event, a different event, the same set of events, or a different set of events can be selected as a source for an ADC trigger; when any of these selected events occur, an ADC trigger pulse is generated. The selection of events allows the interrupt or ADC trigger to occur at a specific position

within the pwmA or pwmB signal. Note that interrupts and ADC triggers are based on the raw events; delays in the PWM signal edges caused by the dead-band generator are not taken into account.

### 21.3.6 Synchronization Methods

The PWM module provides four PWM generators, each providing two PWM outputs that may be used in a wide variety of applications. Generally speaking, the PWM is used in one of two categories of operation:

- **Unsynchronized.** The PWM generator and its two output signals are used alone, independent of other PWM generators.
- **Synchronized.** The PWM generator and its two outputs signals are used in conjunction with other PWM generators using a common, unified time base. If multiple PWM generators are configured with the same counter load value, synchronization can be used to guarantee that they also have the same count value (the PWM generators must be configured before they are synchronized). With this feature, more than two PWMn signals can be produced with a known relationship between the edges of those signals because the counters always have the same values. Other states in the module provide mechanisms to maintain the common time base and mutual synchronization.

The counter in a PWM generator can be reset to zero by writing the **PWM Time Base Sync (PWMSYNC)** register and setting the SYNCn bit associated with the generator. Multiple PWM generators can be synchronized together by setting all necessary SYNCn bits in one access. For example, setting the SYNC0 and SYNC1 bits in the **PWMSYNC** register causes the counters in PWM generators 0 and 1 to reset together.

Additional synchronization can occur between multiple PWM generators by updating register contents in one of the following three ways:

- **Immediately.** The write value has immediate effect, and the hardware reacts immediately.
- **Locally Synchronized.** The write value does not affect the logic until the counter reaches the value zero at the end of the PWM cycle. In this case, the effect of the write is deferred, providing a guaranteed defined behavior and preventing overly short or overly long output PWM pulses.
- **Globally Synchronized.** The write value does not affect the logic until two sequential events have occurred: (1) the Update mode for the generator function is programmed for global synchronization in the **PWMnCTL** register, and (2) the counter reaches zero at the end of the PWM cycle. In this case, the effect of the write is deferred until the end of the PWM cycle following the end of all updates. This mode allows multiple items in multiple PWM generators to be updated simultaneously without odd effects during the update; everything runs from the old values until a point at which they all run from the new values. The Update mode of the load and comparator match values can be individually configured in each PWM generator block. It typically makes sense to use the synchronous update mechanism across PWM generator blocks when the timers in those blocks are synchronized, although this is not required in order for this mechanism to function properly.

The following registers provide either local or global synchronization based on the state of various Update mode bits and fields in the **PWMnCTL** register (LOADUPD; CMPAUPD; CMPBUPD):

- Generator Registers: **PWMnLOAD**, **PWMnCMPA**, and **PWMnCMPB**

The following registers default to immediate update, but are provided with the optional functionality of synchronously updating rather than having all updates take immediate effect:

- Module-Level Register: **PWMENABLE** (based on the state of the ENUPDn bits in the PWMENUPD register).
- Generator Register: **PWMnGENA**, **PWMnGENB**, **PWMnDBCTL**, **PWMnDBRISE**, and **PWMnDBFALL** (based on the state of various Update mode bits and fields in the **PWMnCTL** register (GENAUPD; GENBUPD; DBCTLUPD; DBRISEUPD; DBFALLUPD)).

All other registers are considered statically provisioned for the execution of an application or are used dynamically for purposes unrelated to maintaining synchronization and therefore do not need synchronous update functionality.

### 21.3.7 Fault Conditions

A fault condition is one in which the controller must be signaled to stop normal PWM function and then set the PWMn signals to a safe state. Two basic situations cause fault conditions:

- The microcontroller is stalled and cannot perform the necessary computation in the time required for motion control
- An external error or event is detected

The PWM generator can use the following inputs to generate a fault condition, including:

- FAULTn pin assertion
- A stall of the controller generated by the debugger
- The trigger of an ADC digital comparator

Fault conditions are calculated on a per-PWM generator basis. Each PWM generator configures the necessary conditions to indicate a fault condition exists. This method allows the development of applications with dependent and independent control.

Four fault input pins (FAULT0-FAULT3). These inputs may be used with circuits that generate an active High or active Low signal to indicate an error condition. A FAULTn pins may be individually programmed for the appropriate logic sense using the **PWMnFLTSEN** register.

The PWM generator's mode control, including fault condition handling, is provided in the **PWMnCTL** register. This register determines whether the input or a combination of FAULTn input signals and/or digital comparator triggers (as configured by the **PWMnFLTSRC0** and **PWMnFLTSRC1** registers) is used to generate a fault condition. The **PWMnCTL** register also selects whether the fault condition is maintained as long as the external condition lasts or if it is latched until the fault condition until cleared by software. Finally, this register also enables a counter that may be used to extend the period of a fault condition for external events to assure that the duration is a minimum length. The minimum fault period count is specified in the **PWMnMINFLTPER** register.

Status regarding the specific fault cause is provided in the **PWMnFLTSTAT0** and **PWMnFLTSTAT1** registers.

PWM generator fault conditions may be promoted to a controller interrupt using the **PWMINTEN** register.

### 21.3.8 Output Control Block

The output control block takes care of the final conditioning of the pwmA' and pwmB' signals before they go to the pins as the PWMn signals. Via a single register, the **PWM Output Enable** (**PWENABLE**) register, the set of PWM signals that are actually enabled to the pins can be modified.

This function can be used, for example, to perform commutation of a brushless DC motor with a single register write (and without modifying the individual PWM generators, which are modified by the feedback control loop). In addition, the updating of the bits in the **PWMENABLE** register can be configured to be immediate or locally or globally synchronized to the next synchronous update using the **PWM Enable Update (PWMENUPD)** register.

During fault conditions, the PWM output signals, PWMn, usually must be driven to safe values so that external equipment may be safely controlled. The **PWMFAULT** register specifies whether during a fault condition, the generated signal continues to be passed driven or to an encoding specified in the **PWMFAULTVAL** register.

A final inversion can be applied to any of the PWMn signals, making them active Low instead of the default active High using the **PWM Output Inversion (PWMINVERT)**. The inversion is applied even if a value has been enabled in the **PWMFAULT** register and specified in the **PWMFAULTVAL** register. In other words, if a bit is set in the **PWMFAULT**, **PWMFAULTVAL**, and **PWMINVERT** registers, the output on the PWMn signal is 0, not 1 as specified in the **PWMFAULTVAL** register.

## 21.4 Initialization and Configuration

The following example shows how to initialize PWM Generator 0 with a 25-kHz frequency, a 25% duty cycle on the PWM0 pin, and a 75% duty cycle on the PWM1 pin. This example assumes the system clock is 20 MHz.

1. Enable the PWM clock by writing a value of 0x0010.0000 to the **RCGC0** register in the System Control module (see page 268).
2. Enable the clock to the appropriate GPIO module via the **RCGC2** register in the System Control module (see page 288).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 24-4 on page 1138.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the PWM signals to the appropriate pins (see page 465 and Table 24-5 on page 1147).
5. Configure the **Run-Mode Clock Configuration (RCC)** register in the System Control module to use the PWM divide (USEPWMDIV) and set the divider (PWMDIV) to divide by 2 (000).
6. Configure the PWM generator for countdown mode with immediate updates to the parameters.
  - Write the **PWM0CTL** register with a value of 0x0000.0000.
  - Write the **PWM0GENA** register with a value of 0x0000.008C.
  - Write the **PWM0GENB** register with a value of 0x0000.080C.
7. Set the period. For a 25-KHz frequency, the period = 1/25,000, or 40 microseconds. The PWM clock source is 10 MHz; the system clock divided by 2. Thus there are 400 clock ticks per period. Use this value to set the **PWM0LOAD** register. In Count-Down mode, set the LOAD field in the **PWM0LOAD** register to the requested period minus one.
  - Write the **PWM0LOAD** register with a value of 0x0000.018F.
8. Set the pulse width of the PWM0 pin for a 25% duty cycle.
  - Write the **PWM0CMPA** register with a value of 0x0000.012B.

9. Set the pulse width of the PWM1 pin for a 75% duty cycle.
  - Write the **PWM0CMPB** register with a value of 0x0000.0063.
10. Start the timers in PWM generator 0.
  - Write the **PWM0CTL** register with a value of 0x0000.0001.
11. Enable PWM outputs.
  - Write the **PWMENABLE** register with a value of 0x0000.0003.

## 21.5 Register Map

Table 21-3 on page 1025 lists the PWM registers. The offset listed is a hexadecimal increment to the register's address, relative to the PWM module's base address:

- PWM0: 0x4002.8000

Note that the PWM module clock must be enabled before the registers can be programmed (see page 268). There must be a delay of 3 system clocks after the PWM module clock is enabled before any PWM module registers are accessed.

**Table 21-3. PWM Register Map**

| Offset | Name        | Type  | Reset       | Description                       | See page |
|--------|-------------|-------|-------------|-----------------------------------|----------|

## 21.6 Register Descriptions

The remainder of this section lists and describes the PWM registers, in numerical order by address offset.

## Register 1: PWM Master Control (PWMCTL), offset 0x000

This register provides master control over the PWM generation blocks.

### PWM Master Control (PWMCTL)

PWM0 base: 0x4002.8000

Offset 0x000

Type R/W, reset 0x0000.0000

## Register 2: PWM Time Base Sync (PWMSYNC), offset 0x004

This register provides a method to perform synchronization of the counters in the PWM generation blocks. Setting a bit in this register causes the specified counter to reset back to 0; setting multiple bits resets multiple counters simultaneously. The bits auto-clear after the reset has occurred; reading them back as zero indicates that the synchronization has completed.

### PWM Time Base Sync (PWMSYNC)

**Register 3: PWM Output Enable (PWMENABLE), offset 0x008**

This register provides a master control of which generated pwmA' and pwmB' signals are output to the PWMn pins. By disabling a PWM output, the generation process can continue (for example, when the time bases are synchronized) without driving PWM signals to the pins. When bits in this register are set, the corresponding pwmA' or pwmB' signal is passed through to the output stage. When bits are clear, the pwmA' or pwmB' signal is replaced by a zero value which is also passed to the output stage. The **PWMINVERT** register controls the output stage, so if the corresponding bit is set in that register, the value seen on the PWMn signal is inverted from what is configured by the bits in this register. Updates to the bits in this register can be immediate or locally or globally synchronized to the next synchronous update as controlled by the ENUPDn fields in the **PWMENUPD** register.

**PWM Output Enable (PWMENABLE)**

**Register 4: PWM Output Inversion (PWMINVERT), offset 0x00C**

This register provides a master control of the polarity of the PWMn signals on the device pins. The pwmA' and pwmB' signals generated by the PWM generator are active High; but can be made active Low via this register. Disabled PWM channels are also passed through the output inverter (if so configured) so that inactive signals can be High. In addition, if the **PWMFAULT** register enables a specific value to be placed on the PWMn signals during a fault condition, that value is inverted if the corresponding bit in this register is set.

**Register 5: PWM Output Fault (PWMFAULT), offset 0x010**

This register controls the behavior of the PWMn outputs in the presence of fault conditions. Both the fault inputs (FAULTn pins and digital comparator outputs) and debug events are considered fault conditions. On a fault condition, each pwmA' or pwmB' signal can be passed through unmodified or driven to the value specified by the corresponding bit in the **PWMFAULTVAL** register. For outputs that are configured for pass-through, the debug event handling on the corresponding PWM generator also determines if the pwmA' or pwmB' signal continues to be generated.

Fault condition control occurs before the output inverter, so PWM signals driven to a specified value on fault are inverted if the channel is configured for inversion (therefore, the pin is driven to the logical complement of the specified value on a fault condition).

**Register 7: PWM Raw Interrupt Status (PWMRIS), offset 0x018**

This register provides the current set of interrupt sources that are asserted, regardless of whether they are enabled to cause an interrupt to be asserted to the interrupt controller. The fault interrupt is asserted based on the fault condition source that is specified by the **PWMnCTL**, **PWMnFLTSRC0** and **PWMnFLTSRC1** registers. The fault interrupt is latched on detection and must be cleared through the **PWM Interrupt Status and Clear (PWMISC)** register. The actual value of the FAULTn signals can be observed using the **PWMSTATUS** register.

The PWM generator interrupts simply reflect the status of the PWM generators and are cleared via the interrupt status register in the PWM generator blocks. If a bit is set, the event is active; if a bit is clear the event is not active.

**PWM Raw Interrupt Status (PWMRIS)**

PWM0 base: 0x4002.8000

Offset 0x018

Type RO, reset 0x0000.0000

Value Description

1 The PWM generator 0 block interrupt is asserted.

0 The PWM generator 0 block interrupt has not been asserted.

The **PWM0RIS** register shows the source of this interrupt. This bit is cleared by writing a 1 to the corresponding bit in the **PWM0ISC** register.

## Register 8: PWM Interrupt Status and Clear (PWMISC), offset 0x01C

This register provides a summary of the interrupt status of the individual PWM generator blocks. If a fault interrupt is set, the corresponding FAULTn input has caused an interrupt. For the fault interrupt, a write of 1 to that bit position clears the latched interrupt status. If an block interrupt bit is set, the corresponding generator block is asserting an interrupt. The individual interrupt status registers, **PWMnISC**, in each block must be consulted to determine the reason for the interrupt and used to clear the interrupt.

| 1 | An enabled interrupt for the PWM generator 0 block is asserted.        |
| 0 | The PWM generator 0 block interrupt is not asserted or is not enabled. |

The **PWM0RIS** register shows the source of this interrupt. This bit is cleared by writing a 1 to the corresponding bit in the **PWM0ISC** register.

**Register 9: PWM Status (PWMSTATUS), offset 0x020**

This register provides the unlatched status of the PWM generator fault condition.

**PWM Status (PWMSTATUS)**

PWM0 base: 0x4002.8000

Offset 0x020

Type RO, reset 0x0000.0000

**Register 10: PWM Fault Condition Value (PWMFAULTVAL), offset 0x024**

This register specifies the output value driven on the PWMn signals during a fault condition if enabled by the corresponding bit in the **PWMFAULT** register. Note that if the corresponding bit in the **PWMINVERT** register is set, the output value is driven to the logical NOT of the bit value in this register.

**PWM Fault Condition Value (PWMFAULTVAL)**

PWM0 base: 0x4002.8000

**Register 11: PWM Enable Update (PWMENUPD), offset 0x028**

This register specifies when updates to the PWMnEN bit in the **PWMENABLE** register are performed. The PWMnEN bit enables the pwmA' or pwmB' output to be passed to the microcontroller's pin. Updates can be immediate or locally or globally synchronized to the next synchronous update.

**PWM Enable Update (PWMENUPD)**

**Register 12: PWM0 Control (PWM0CTL), offset 0x040****Register 13: PWM1 Control (PWM1CTL), offset 0x080****Register 14: PWM2 Control (PWM2CTL), offset 0x0C0****Register 15: PWM3 Control (PWM3CTL), offset 0x100**

These registers configure the PWM signal generation blocks (PWM0CTL controls the PWM generator 0 block, and so on). The Register Update mode, Debug mode, Counting mode, and Block Enable mode are all controlled via these registers. The blocks produce the PWM signals, which can be either two independent PWM signals (from the same counter), or a paired set of PWM signals with dead-band delays added.

The PWM0 block produces the PWM0 and PWM1 outputs, the PWM1 block produces the PWM2 and PWM3 outputs, the PWM2 block produces the PWM4 and PWM5 outputs, and the PWM3 block produces the PWM6 and PWM7 outputs.

**PWM0 Control (PWM0CTL)**

PWM0 base: 0x4002.8000

Offset 0x040

Type R/W, reset 0x0000.0000

| 17        | MINFLTPER | R/W  | 0     | <p>Minimum Fault Period</p> <p>This bit specifies that the PWM generator enables a one-shot counter to provide a minimum fault condition period.</p> <p>The timer begins counting on the rising edge of the fault condition to extend the condition for a minimum duration of the count value. The timer ignores the state of the fault condition while counting.</p> <p>The minimum fault delay is in effect only when the MINFLTPER bit is set. If a detected fault is in the process of being extended when the MINFLTPER bit is cleared, the fault condition extension is aborted.</p> <p>The delay time is specified by the <b>PWMnMINFLTPER</b> register MFP field value. The effect of this is to pulse stretch the fault condition input.</p> <p>The delay value is defined by the PWM clock period. Because the fault input is not synchronized to the PWM clock, the period of the time is <math>PWMClock * (MFP \text{ value} + 1)</math> or <math>PWMClock * (MFP \text{ value} + 2)</math>.</p> <p>The delay function makes sense only if the fault source is unlatched. A latched fault source makes the fault condition appear asserted until cleared by software and negates the utility of the extend feature. It applies to all fault condition sources as specified in the FLTSRC field.</p> <p>Value Description</p> <p>0 The FAULT input deassertion is unaffected.</p> <p>1 The <b>PWMnMINFLTPER</b> one-shot counter is active and extends the period of the fault condition to a minimum period.</p> |
| 16        | FLTSRC    | R/W  | 0     | <p>Fault Condition Source</p> <p>Value Description</p> <p>0 The Fault condition is determined by the Fault0 input.</p> <p>1 The Fault condition is determined by the configuration of the <b>PWMnFLTSRC0</b> and <b>PWMnFLTSRC1</b> registers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 1         | MODE   | R/W  | 0     | Counter Mode<br><br>Value Description<br>0 The counter counts down from the load value to 0 and then wraps back to the load value (Count-Down mode).<br>1 The counter counts up from 0 to the load value, back down to 0, and then repeats (Count-Up/Down mode). |
| 0         | ENABLE | R/W  | 0     | PWM Block Enable<br><br>Value Description<br>0 The entire PWM generation block is disabled and not clocked.<br>1 The PWM generation block is enabled and produces PWM signals.                                                                                   |

**Register 16: PWM0 Interrupt and Trigger Enable (PWM0INTEN), offset 0x044**

**Register 17: PWM1 Interrupt and Trigger Enable (PWM1INTEN), offset 0x084**

**Register 18: PWM2 Interrupt and Trigger Enable (PWM2INTEN), offset 0x0C4**

**Register 19: PWM3 Interrupt and Trigger Enable (PWM3INTEN), offset 0x104**

These registers control the interrupt and ADC trigger generation capabilities of the PWM generators (**PWM0INTEN** controls the PWM generator 0 block, and so on). The events that can cause an interrupt or an ADC trigger are:

- The counter being equal to the load register
- The counter being equal to zero
- The counter being equal to the **PWMnCMPA** register while counting up
- The counter being equal to the **PWMnCMPA** register while counting down
- The counter being equal to the **PWMnCMB** register while counting up
- The counter being equal to the **PWMnCMB** register while counting down

Any combination of these events can generate either an interrupt or an ADC trigger, though no determination can be made as to the actual event that caused an ADC trigger if more than one is specified. The **PWMnRIS** register provides information about which events have caused raw interrupts.

#### PWM0 Interrupt and Trigger Enable (PWM0INTEN)

PWM0 base: 0x4002.8000  
Offset 0x044  
Type R/W, reset 0x0000.0000

**Register 20: PWM0 Raw Interrupt Status (PWM0RIS), offset 0x048****Register 21: PWM1 Raw Interrupt Status (PWM1RIS), offset 0x088****Register 22: PWM2 Raw Interrupt Status (PWM2RIS), offset 0x0C8****Register 23: PWM3 Raw Interrupt Status (PWM3RIS), offset 0x108**

These registers provide the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (**PWM0RIS** controls the PWM generator 0 block, and so on). If a bit is set, the event has occurred; if a bit is clear, the event has not occurred. Bits in this register are cleared by writing a 1 to the corresponding bit in the **PWMnISC** register.

**PWM0 Raw Interrupt Status (PWM0RIS)**

PWM0 base: 0x4002.8000

Offset 0x048

Type RO, reset 0x0000.0000

**Register 24: PWM0 Interrupt Status and Clear (PWM0ISC), offset 0x04C****Register 25: PWM1 Interrupt Status and Clear (PWM1ISC), offset 0x08C****Register 26: PWM2 Interrupt Status and Clear (PWM2ISC), offset 0x0CC****Register 27: PWM3 Interrupt Status and Clear (PWM3ISC), offset 0x10C**

These registers provide the current set of interrupt sources that are asserted to the interrupt controller (**PWM0ISC** controls the PWM generator 0 block, and so on). A bit is set if the event has occurred and is enabled in the **PWMnINTEN** register; if a bit is clear, the event has not occurred or is not enabled. These are R/W1C registers; writing a 1 to a bit position clears the corresponding interrupt reason.

**PWM0 Interrupt Status and Clear (PWM0ISC)**

**Register 28: PWM0 Load (PWM0LOAD), offset 0x050****Register 29: PWM1 Load (PWM1LOAD), offset 0x090****Register 30: PWM2 Load (PWM2LOAD), offset 0x0D0****Register 31: PWM3 Load (PWM3LOAD), offset 0x110**

These registers contain the load value for the PWM counter (**PWM0LOAD** controls the PWM generator 0 block, and so on). Based on the counter mode configured by the **MODE** bit in the **PWMnCTL** register, this value is either loaded into the counter after it reaches zero or is the limit of up-counting after which the counter decrements back to zero. When this value matches the counter, a pulse is output which can be configured to drive the generation of the pwmA and/or pwmB signal (via the **PWMnGENA/PWMnGENB** register) or drive an interruptor ADC trigger (via the **PWMnINTEN** register).

If the Load Value Update mode is locally synchronized (based on the **LOADUPD** field encoding in the **PWMnCTL** register), the 16-bit **LOAD** value is used the next time the counter reaches zero. If the update mode is globally synchronized, it is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1029). If this register is re-written before the actual update occurs, the previous value is never used and is lost.

**PWM0 Load (PWM0LOAD)**

| 15:0      | COUNT    | RO   | 0x0000 | Counter Value<br>The current value of the counter.                                                                                                                                            |

**Register 36: PWM0 Compare A (PWM0CMPA), offset 0x058****Register 37: PWM1 Compare A (PWM1CMPA), offset 0x098****Register 38: PWM2 Compare A (PWM2CMPA), offset 0x0D8****Register 39: PWM3 Compare A (PWM3CMPA), offset 0x118**

These registers contain a value to be compared against the counter (**PWM0CMPA** controls the PWM generator 0 block, and so on). When this value matches the counter, a pulse is output which can be configured to drive the generation of the pwmA and pwmB signals (via the **PWMnGENA** and **PWMnGENB** registers) or drive an interrupt or ADC trigger (via the **PWMnINTEN** register). If the value of this register is greater than the **PWMnLOAD** register (see page 1066), then no pulse is ever output.

If the comparator A update mode is locally synchronized (based on the CMPAUPD bit in the **PWMnCTL** register), the 16-bit COMPA value is used the next time the counter reaches zero. If the update mode is globally synchronized, it is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1029). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**PWM0 Compare A (PWM0CMPA)**

**Register 44: PWM0 Generator A Control (PWM0GENA), offset 0x060****Register 45: PWM1 Generator A Control (PWM1GENA), offset 0x0A0****Register 46: PWM2 Generator A Control (PWM2GENA), offset 0x0E0****Register 47: PWM3 Generator A Control (PWM3GENA), offset 0x120**

These registers control the generation of the pwmA signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENA** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENA** register controls generation of the pwm0A signal; **PWM1GENA**, the pwm1A signal; **PWM2GENA**, the pwm2A signal; and **PWM3GENA**, the pwm3A signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare A action is taken and the compare B action is ignored.

If the Generator A update mode is immediate (based on the GENAUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1029). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 48: PWM0 Generator B Control (PWM0GENB), offset 0x064****Register 49: PWM1 Generator B Control (PWM1GENB), offset 0x0A4****Register 50: PWM2 Generator B Control (PWM2GENB), offset 0x0E4****Register 51: PWM3 Generator B Control (PWM3GENB), offset 0x124**

These registers control the generation of the pwmB signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENB** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENB** register controls generation of the pwm0B signal; **PWM1GENB**, the pwm1B signal; **PWM2GENB**, the pwm2B signal; and **PWM3GENB**, the pwm3B signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare B action is taken and the compare A action is ignored.

If the Generator B update mode is immediate (based on the GENBUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1029). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**PWM0 Generator B Control (PWM0GENB)**

PWM0 base: 0x4002.8000

Offset 0x064

**Register 52: PWM0 Dead-Band Control (PWM0DBCTL), offset 0x068****Register 53: PWM1 Dead-Band Control (PWM1DBCTL), offset 0x0A8****Register 54: PWM2 Dead-Band Control (PWM2DBCTL), offset 0x0E8****Register 55: PWM3 Dead-Band Control (PWM3DBCTL), offset 0x128**

The **PWMnDBCTL** register controls the dead-band generator, which produces the PWMn signals based on the pwmA and pwmB signals. When disabled, the pwmA signal passes through to the pwmA' signal and the pwmB signal passes through to the pwmB' signal. When dead-band control is enabled, the pwmB signal is ignored, the pwmA' signal is generated by delaying the rising edge(s) of the pwmA signal by the value in the **PWMnDBRISE** register (see page 1077), and the pwmB' signal is generated by inverting the pwmA signal and delaying the falling edge(s) of the pwmA signal by the value in the **PWMnDBFALL** register (see page 1078). The Output Control block outputs the pwm0A' signal on the PWM0 signal and the pwm0B' signal on the PWM1 signal. In a similar manner, PWM2 and PWM3 are produced from the pwm1A' and pwm1B' signals, PWM4 and PWM5 are produced from the pwm2A' and pwm2B' signals, and PWM6 and PWM7 are produced from the pwm3A' and pwm3B' signals.

If the Dead-Band Control mode is immediate (based on the DBCTLUPD field encoding in the **PWMnCTL** register), the ENABLE bit value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1029). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 56: PWM0 Dead-Band Rising-Edge Delay (PWM0DBRISE), offset 0x06C**

**Register 57: PWM1 Dead-Band Rising-Edge Delay (PWM1DBRISE), offset 0x0AC**

**Register 58: PWM2 Dead-Band Rising-Edge Delay (PWM2DBRISE), offset 0x0EC**

**Register 59: PWM3 Dead-Band Rising-Edge Delay (PWM3DBRISE), offset 0x12C**

The **PWMnDBRISE** register contains the number of clock cycles to delay the rising edge of the pwmA signal when generating the pwmA' signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a High pulse on the pwmA signal, the rising-edge delay consumes the entire High time of the signal, resulting in no High time on the output. Care must be taken to ensure that the pwmA High time always exceeds the rising-edge delay.

If the Dead-Band Rising-Edge Delay mode is immediate (based on the DBRISEUPD field encoding in the **PWMnCTL** register), the 12-bit RISEDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1029). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

| 31:12     | reserved  | RO   | 0x0000.0 | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation. |
| 11:0      | RISEDELAY | R/W  | 0x000    | Dead-Band Rise Delay<br>The number of clock cycles to delay the rising edge of pwmA' after the rising edge of pwmA.                                                                           |

**Register 60: PWM0 Dead-Band Falling-Edge-Delay (PWM0DBFALL), offset 0x070**

**Register 61: PWM1 Dead-Band Falling-Edge-Delay (PWM1DBFALL), offset 0x0B0**

**Register 62: PWM2 Dead-Band Falling-Edge-Delay (PWM2DBFALL), offset 0x0F0**

**Register 63: PWM3 Dead-Band Falling-Edge-Delay (PWM3DBFALL), offset 0x130**

The **PWMnDBFALL** register contains the number of clock cycles to delay the rising edge of the pwmB' signal from the falling edge of the pwmA signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a Low pulse on the pwmA signal, the falling-edge delay consumes the entire Low time of the signal, resulting in no Low time on the output. Care must be taken to ensure that the pwmA Low time always exceeds the falling-edge delay.

If the Dead-Band Falling-Edge-Delay mode is immediate (based on the DBFALLUP field encoding in the **PWMnCTL** register), the 12-bit FALLDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 1029). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 64: PWM0 Fault Source 0 (PWM0FLTSRC0), offset 0x074****Register 65: PWM1 Fault Source 0 (PWM1FLTSRC0), offset 0x0B4****Register 66: PWM2 Fault Source 0 (PWM2FLTSRC0), offset 0x0F4****Register 67: PWM3 Fault Source 0 (PWM3FLTSRC0), offset 0x134**

This register specifies which fault pin inputs are used to generate a fault condition. Each bit in the following register indicates whether the corresponding fault pin is included in the fault condition. All enabled fault pins are ORed together to form the **PWMnFLTSRC0** portion of the fault condition. The **PWMnFLTSRC0** fault condition is then ORed with the **PWMnFLTSRC1** fault condition to generate the final fault condition for the PWM generator.

If the FLTSRC bit in the **PWMnCTL** register (see page 1054) is clear, only the **Fault0** signal affects the fault condition generated. Otherwise, sources defined in **PWMnFLTSRC0** and **PWMnFLTSRC1** affect the fault condition generated.

**Register 68: PWM0 Fault Source 1 (PWM0FLTSRC1), offset 0x078****Register 69: PWM1 Fault Source 1 (PWM1FLTSRC1), offset 0x0B8****Register 70: PWM2 Fault Source 1 (PWM2FLTSRC1), offset 0x0F8****Register 71: PWM3 Fault Source 1 (PWM3FLTSRC1), offset 0x138**

This register specifies which digital comparator triggers from the ADC are used to generate a fault condition. Each bit in the following register indicates whether the corresponding digital comparator trigger is included in the fault condition. All enabled digital comparator triggers are ORed together to form the **PWMnFLTSRC1** portion of the fault condition. The **PWMnFLTSRC1** fault condition is then ORed with the **PWMnFLTSRC0** fault condition to generate the final fault condition for the PWM generator.

If the FLTSRC bit in the **PWMnCTL** register (see page 1054) is clear, only the PWM Fault pin affects the fault condition generated. Otherwise, sources defined in **PWMnFLTSRC0** and **PWMnFLTSRC1** affect the fault condition generated.

**PWM0 Fault Source 1 (PWM0FLTSRC1)**

**Register 72: PWM0 Minimum Fault Period (PWM0MINFLTPER), offset 0x07C**

**Register 73: PWM1 Minimum Fault Period (PWM1MINFLTPER), offset 0x0BC**

**Register 74: PWM2 Minimum Fault Period (PWM2MINFLTPER), offset 0x0FC**

**Register 75: PWM3 Minimum Fault Period (PWM3MINFLTPER), offset 0x13C**

If the MINFLTPER bit in the **PWMnCTL** register is set, this register specifies the 16-bit time-extension value to be used in extending the fault condition. The value is loaded into a 16-bit down counter, and the counter value is used to extend the fault condition. The fault condition is released in the clock immediately after the counter value reaches 0. The fault condition is asynchronous to the PWM clock; and the delay value is the product of the PWM clock period and the (MFP field value + 1) or (MFP field value + 2) depending on when the fault condition asserts with respect to the PWM clock. The counter decrements at the PWM clock rate, without pause or condition.

**Register 80: PWM0 Fault Status 0 (PWM0FLTSTAT0), offset 0x804****Register 81: PWM1 Fault Status 0 (PWM1FLTSTAT0), offset 0x884****Register 82: PWM2 Fault Status 0 (PWM2FLTSTAT0), offset 0x904****Register 83: PWM3 Fault Status 0 (PWM3FLTSTAT0), offset 0x984**

Along with the **PWMnFLTSTAT1** register, this register provides status regarding the fault condition inputs.

If the LATCH bit in the **PWMnCTL** register is clear, the contents of the **PWMnFLTSTAT0** register are read-only (RO) and provide the current state of the FAULTn inputs.

If the LATCH bit in the **PWMnCTL** register is set, the contents of the **PWMnFLTSTAT0** register are read / write 1 to clear (R/W1C) and provide a latched version of the FAULTn inputs. In this mode, the register bits are cleared by writing a 1 to a set bit. The FAULTn inputs are recorded after their sense is adjusted in the generator.

The contents of this register can only be written if the fault source extensions are enabled (the FLTSRC bit in the **PWMnCTL** register is set).

## 22 Quadrature Encoder Interface (QEI)

A quadrature encoder, also known as a 2-channel incremental encoder, converts linear displacement into a pulse signal. By monitoring both the number of pulses and the relative phase of the two signals, you can track the position, direction of rotation, and speed. In addition, a third channel, or index signal, can be used to reset the position counter.

The LM3S5R31 microcontroller includes two quadrature encoder interface (QEI) modules. Each QEI module interprets the code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The Stellaris® LM3S5R31 microcontroller includes two QEI modules providing control of two motors at the same time with the following features:

- Position integrator that tracks the encoder position
- Programmable noise filter on the inputs
- Velocity capture using built-in timer
- The input frequency of the QEI inputs may be as high as 1/4 of the processor frequency (for example, 12.5 MHz for a 50-MHz system)
- Interrupt generation on:
  - Index pulse
  - Velocity-timer expiration
  - Direction change
  - Quadrature error detection

### 22.1 Block Diagram

Figure 22-1 on page 1092 provides a block diagram of a Stellaris QEI module.

Figure 22-1. QEI Block Diagram

## 22.2 Signal Description

The following table lists the external signals of the QEI module and describes the function of each. The QEI signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these QEI signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 447) should be set to choose the QEI function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOPCTL)** register (page 465) to assign the QEI signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 423.

Table 22-1. Signals for QEI (100LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description           |
|----------|------------|--------------------------|----------|--------------------------|-----------------------|

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 22.3 Functional Description

The QE1 module interprets the two-bit gray code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The position integrator and velocity capture can be independently enabled, though the position integrator must be enabled before the velocity capture can be enabled. The two phase signals, PhA and PhB, can be swapped before being interpreted by the QE1 module to change the meaning of forward and backward and to correct for miswiring of the system. Alternatively, the phase signals can be interpreted as a clock and direction signal as output by some encoders.

The QEI module input signals have a digital noise filter on them that can be enabled to prevent spurious operation. The noise filter requires that the inputs be stable for a specified number of consecutive clock cycles before updating the edge detector. The filter is enabled by the **FILTEN** bit in the **QEI Control (QEICTL)** register. The frequency of the input update is programmable using the **FILTCNT** bit field in the **QEICTL** register.

The QEI module supports two modes of signal operation: quadrature phase mode and clock/direction mode. In quadrature phase mode, the encoder produces two clocks that are 90 degrees out of phase; the edge relationship is used to determine the direction of rotation. In clock/direction mode, the encoder produces a clock signal to indicate steps and a direction signal to indicate the direction of rotation. This mode is determined by the **SIGMODE** bit of the **QEICTL** register (see page 1098).

When the QEI module is set to use the quadrature phase mode (**SIGMODE** bit is clear), the capture mode for the position integrator can be set to update the position counter on every edge of the PhA signal or to update on every edge of both PhA and PhB. Updating the position counter on every PhA and PhB edge provides more positional resolution at the cost of less range in the positional counter.

When edges on PhA lead edges on PhB, the position counter is incremented. When edges on PhB lead edges on PhA, the position counter is decremented. When a rising and falling edge pair is seen on one of the phases without any edges on the other, the direction of rotation has changed.

The positional counter is automatically reset on one of two conditions: sensing the index pulse or reaching the maximum position value. The reset mode is determined by the **RESMODE** bit of the **QEICTL** register.

When **RESMODE** is set, the positional counter is reset when the index pulse is sensed. This mode limits the positional counter to the values [0:N-1], where N is the number of phase edges in a full revolution of the encoder wheel. The **QEI Maximum Position (QEIMAXPOS)** register must be programmed with N-1 so that the reverse direction from position 0 can move the position counter to N-1. In this mode, the position register contains the absolute position of the encoder relative to the index (or home) position once an index pulse has been seen.

When **RESMODE** is clear, the positional counter is constrained to the range [0:M], where M is the programmable maximum value. The index pulse is ignored by the positional counter in this mode.

Velocity capture uses a configurable timer and a count register. The timer counts the number of phase edges (using the same configuration as for the position integrator) in a given time period. The edge count from the previous time period is available to the controller via the **QEI Velocity (QEISPEED)** register, while the edge count for the current time period is being accumulated in the **QEI Velocity Counter (QEICOUNT)** register. As soon as the current time period is complete, the total number of edges counted in that time period is made available in the **QEISPEED** register (overwriting the previous value), the **QEICOUNT** register is cleared, and counting commences on a new time period. The number of edges counted in a given time period is directly proportional to the velocity of the encoder.

Figure 22-2 on page 1095 shows how the Stellaris quadrature encoder converts the phase input signals into clock pulses, the direction signal, and how the velocity predivider operates (in Divide by 4 mode).

**Figure 22-2. Quadrature Encoder and Velocity Predivider Operation**

The period of the timer is configurable by specifying the load value for the timer in the **QEI Timer Load (QEILOAD)** register. When the timer reaches zero, an interrupt can be triggered, and the hardware reloads the timer with the **QEILOAD** value and continues to count down. At lower encoder speeds, a longer timer period is required to be able to capture enough edges to have a meaningful result. At higher encoder speeds, both a shorter timer period and/or the velocity predivider can be used.

The following equation converts the velocity counter value into an rpm value:

$$\text{rpm} = (\text{clock} * (2 ^ \text{VELDIV}) * \text{SPEED} * 60) \div (\text{LOAD} * \text{ppr} * \text{edges})$$

where:

clock is the controller clock rate

ppr is the number of pulses per revolution of the physical encoder

edges is 2 or 4, based on the capture mode set in the **QEICTL** register (2 for CAPMODE clear and 4 for CAPMODE set)

For example, consider a motor running at 600 rpm. A 2048 pulse per revolution quadrature encoder is attached to the motor, producing 8192 phase edges per revolution. With a velocity predivider of ÷1 (VELDIV is clear) and clocking on both PhA and PhB edges, this results in 81,920 pulses per second (the motor turns 10 times per second). If the timer were clocked at 10,000 Hz, and the load value was 2,500 (¼ of a second), it would count 20,480 pulses per update. Using the above equation:

$$\text{rpm} = (10000 * 1 * 20480 * 60) \div (2500 * 2048 * 4) = 600 \text{ rpm}$$

Now, consider that the motor is sped up to 3000 rpm. This results in 409,600 pulses per second, or 102,400 every ¼ of a second. Again, the above equation gives:

$$\text{rpm} = (10000 * 1 * 102400 * 60) \div (2500 * 2048 * 4) = 3000 \text{ rpm}$$

Care must be taken when evaluating this equation because intermediate values may exceed the capacity of a 32-bit integer. In the above examples, the clock is 10,000 and the divisor is 2,500; both could be predivided by 100 (at compile time if they are constants) and therefore be 100 and 25. In fact, if they were compile-time constants, they could also be reduced to a simple multiply by 4, cancelled by the ÷4 for the edge-count factor.

**Important:** Reducing constant factors at compile time is the best way to control the intermediate values of this equation and reduce the processing requirement of computing this equation.

The division can be avoided by selecting a timer load value such that the divisor is a power of 2; a simple shift can therefore be done in place of the division. For encoders with a power of 2 pulses per revolution, the load value can be a power of 2. For other encoders, a load value must be selected such that the product is very close to a power of 2. For example, a 100 pulse-per-revolution encoder

could use a load value of 82, resulting in 32,800 as the divisor, which is 0.09% above  $2^{14}$ . In this case a shift by 15 would be an adequate approximation of the divide in most cases. If absolute accuracy were required, the microcontroller's divide instruction could be used.

The QEI module can produce a controller interrupt on several events: phase error, direction change, reception of the index pulse, and expiration of the velocity timer. Standard masking, raw interrupt status, interrupt status, and interrupt clear capabilities are provided.

## 22.4 Initialization and Configuration

The following example shows how to configure the Quadrature Encoder module to read back an absolute position:

1. Enable the QEI clock by writing a value of 0x0000.0100 to the **RCGC1** register in the System Control module (see page 276).
2. Enable the clock to the appropriate GPIO module via the **RCGC2** register in the System Control module (see page 288).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 24-4 on page 1138.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the QEI signals to the appropriate pins (see page 465 and Table 24-5 on page 1147).
5. Configure the quadrature encoder to capture edges on both signals and maintain an absolute position by resetting on index pulses. A 1000-line encoder with four edges per line, results in 4000 pulses per revolution; therefore, set the maximum position to 3999 (0xF9F) as the count is zero-based.
  - Write the **QEICTL** register with the value of 0x0000.0018.
  - Write the **QEIMAXPOS** register with the value of 0x0000.0F9F.
6. Enable the quadrature encoder by setting bit 0 of the **QEICTL** register.
7. Delay until the encoder position is required.
8. Read the encoder position by reading the **QEI Position (QEIPOS)** register value.

## 22.5 Register Map

Table 22-3 on page 1097 lists the QEI registers. The offset listed is a hexadecimal increment to the register's address, relative to the module's base address:

- QEIO: 0x4002.C000
- QEI1: 0x4002.D000

Note that the QEI module clock must be enabled before the registers can be programmed (see page 276). There must be a delay of 3 system clocks after the QEI module clock is enabled before any QEI module registers are accessed.

**Table 22-3. QEI Register Map**

| Offset | Name      | Type  | Reset       | Description                    | See page |
|--------|-----------|-------|-------------|--------------------------------|----------|
| 0x000  | QEICTL    | R/W   | 0x0000.0000 | QEI Control                    | 1098     |

## 22.6 Register Descriptions

The remainder of this section lists and describes the QEI registers, in numerical order by address offset.

## Register 1: QEI Control (QEICTL), offset 0x000

This register contains the configuration of the QEI module. Separate enables are provided for the quadrature encoder and the velocity capture blocks; the quadrature encoder must be enabled in order to capture the velocity, but the velocity does not need to be captured in applications that do not need it. The phase signal interpretation, phase swap, Position Update mode, Position Reset mode, and velocity predivider are all set via this register.

### QEI Control (QEICTL)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x000  
Type R/W, reset 0x0000.0000

Register 5: QEI Timer Load (QEILOAD), offset 0x010

This register contains the load value for the velocity timer. Because this value is loaded into the timer on the clock cycle after the timer is zero, this value should be one less than the number of clocks in the desired period. So, for example, to have 2000 decimal clocks per timer period, this register should contain 1999 decimal.

QEI Timer Load (QEILOAD)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x010  
Type R/W, reset 0x0000.0000

|       |      |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

| Bit/Field | Name | Type | Reset       | Description                                                         |
|-----------|------|------|-------------|---------------------------------------------------------------------|
| 31:0      | LOAD | R/W  | 0x0000.0000 | Velocity Timer Load Value<br>The load value for the velocity timer. |

Register 6: QEI Timer (QEITIME), offset 0x014

This register contains the current value of the velocity timer. This counter does not increment when the VELEN bit in the QEICTL register is clear.

QEI Timer (QEITIME)

QEIO base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x014  
Type RO, reset 0x0000.0000

| Bit/Field | Name | Type | Reset       | Description                                                              |
|-----------|------|------|-------------|--------------------------------------------------------------------------|
| 31:0      | TIME | RO   | 0x0000.0000 | Velocity Timer Current Value<br>The current value of the velocity timer. |

Register 7: QEI Velocity Counter (QEICOUNT), offset 0x018

This register contains the running count of velocity pulses for the current time period. Because this count is a running total, the time period to which it applies cannot be known with precision (that is, a read of this register does not necessarily correspond to the time returned by the **QEITIME** register because there is a small window of time between the two reads, during which either value may have changed). The **QEISPEED** register should be used to determine the actual encoder velocity; this register is provided for information purposes only. This counter does not increment when the VELEN bit in the **QEICTL** register is clear.

QEI Velocity Counter (QEICOUNT)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x018  
Type RO, reset 0x0000.0000

| Bit/Field | Name  | Type | Reset       | Description                                                                                    |
|-----------|-------|------|-------------|------------------------------------------------------------------------------------------------|
| 31:0      | COUNT | RO   | 0x0000.0000 | Velocity Pulse Count<br>The running total of encoder pulses during this velocity timer period. |

Register 8: QEI Velocity (QEISPEED), offset 0x01C

This register contains the most recently measured velocity of the quadrature encoder. This value corresponds to the number of velocity pulses counted in the previous velocity timer period. This register does not update when the VELEN bit in the **QEICTL** register is clear.

QEI Velocity (QEISPEED)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000

## Register 10: QEI Raw Interrupt Status (QEIRIS), offset 0x024

This register provides the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (configured through the **QEINTEN** register). If a bit is set, the latched event has occurred; if a bit is clear, the event in question has not occurred.

### QEI Raw Interrupt Status (QEIRIS)

## Register 11: QEI Interrupt Status and Clear (QEIISC), offset 0x028

This register provides the current set of interrupt sources that are asserted to the controller. If a bit is set, the latched event has occurred and is enabled to generate an interrupt; if a bit is clear the event in question has not occurred or is not enabled to generate an interrupt. This register is R/W1C; writing a 1 to a bit position clears the bit and the corresponding interrupt reason.

|           |          |       |       | This bit is cleared by writing a 1. Clearing this bit also clears the INTINDEX bit in the <b>QEIRIS</b> register.                               |

## 23 Pin Diagram

The LM3S5R31 microcontroller pin diagram is shown below.

Each GPIO signal is identified by its GPIO port unless it defaults to an alternate function on reset. In this case, the GPIO port name is followed by the default alternate function. To see a complete list of possible functions for each pin, see Table 24-5 on page 1147.

**Figure 23-1. 100-Pin LQFP Package Pin Diagram**

Figure 23-2. 108-Ball BGA Package Pin Diagram (Top View)

## 24 Signal Tables

The following tables list the signals available for each pin. Signals are configured as GPIOs on reset, except for those noted below. Use the **GPIOAMSEL** register (see page 463) to select analog mode. For a GPIO pin to be used for an alternate digital function, the corresponding bit in the **GPIOAFSEL** register (see page 447) must be set. Further pin muxing options are provided through the PMCx bit field in the **GPIOPCTL** register (see page 465), which selects one of several available peripheral functions for that GPIO.

**Important:** All GPIO pins are configured as GPIOs by default with the exception of the pins shown in the table below. A Power-On-Reset (POR) or asserting RST puts the pins back to their default state.

**Table 24-1. GPIO Pins With Default Alternate Functions**

| GPIO Pin | Default State     | GPIOAFSEL Bit | GPIOPCTL PMCx Bit Field |
|----------|-------------------|---------------|-------------------------|
| PA[1:0]  | UART0             | 0             | 0x1                     |
| PA[5:2]  | SSI0              | 0             | 0x1                     |
| PB[3:2]  | I <sup>2</sup> C0 | 0             | 0x1                     |
| PC[3:0]  | JTAG/SWD          | 1             | 0x3                     |

Table 24-2 on page 1117 shows the pin-to-signal-name mapping, including functional characteristics of the signals. Each possible alternate analog and digital function is listed for each pin.

Table 24-3 on page 1128 lists the signals in alphabetical order by signal name. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed. The "Pin Mux" column indicates the GPIO and the encoding needed in the PMCx bit field in the **GPIOPCTL** register.

Table 24-4 on page 1138 groups the signals by functionality, except for GPIOs. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed.

Table 24-5 on page 1147 lists the GPIO pins and their analog and digital alternate functions. The AINx and VREFx analog signals are not 5-V tolerant and go through an isolation circuit before reaching their circuitry. These signals are configured by clearing the corresponding DEN bit in the **GPIO Digital Enable (GPIODEN)** register and setting the corresponding AMSEL bit in the **GPIO Analog Mode Select (GPIOAMSEL)** register. Other analog signals are 5-V tolerant and are connected directly to their circuitry (C0-, C0+, C1-, C1+). These signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. The digital signals are enabled by setting the appropriate bit in the **GPIO Alternate Function Select (GPIOAFSEL)** and **GPIODEN** registers and configuring the PMCx bit field in the **GPIO Port Control (GPIOPCTL)** register to the numeric encoding shown in the table below. Table entries that are shaded gray are the default values for the corresponding GPIO pin.

Table 24-6 on page 1150 lists the signals based on number of possible pin assignments. This table can be used to plan how to configure the pins for a particular functionality. Application Note AN01274 Configuring Stellaris® Microcontrollers with Pin Multiplexing provides an overview of the pin muxing implementation, an explanation of how a system designer defines a pin configuration, and examples of the pin configuration process.

**Note:** All digital inputs are Schmitt triggered.

|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                                      |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                                                                                                                                                                                                                              |
| 2          | PE6      | I/O      | TTL                      | GPIO port E bit 6.                                                                                                                                                                                                                                                                                        |
|            | AIN1     | I        | Analog                   | Analog-to-digital converter input 1.                                                                                                                                                                                                                                                                      |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                                                                                                                                               |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                                      |
|            | U1CTS    | I        | TTL                      | UART module 1 Clear To Send modem flow control input signal.                                                                                                                                                                                                                                              |
| 3          | VDDA     | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                       |
| 4          | GNDA     | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                         |
| 5          | PE5      | I/O      | TTL                      | GPIO port E bit 5.                                                                                                                                                                                                                                                                                        |
|            | AIN2     | I        | Analog                   | Analog-to-digital converter input 2.                                                                                                                                                                                                                                                                      |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                                                                                                                                                                                                                    |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                                                                                                                                                                                                                                  |
| 6          | PE4      | I/O      | TTL                      | GPIO port E bit 4.                                                                                                                                                                                                                                                                                        |
|            | AIN3     | I        | Analog                   | Analog-to-digital converter input 3.                                                                                                                                                                                                                                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                                                                                                                                                    |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                                                              |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                                                                                                                                                                                                                           |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                               |
| 7          | LDO      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 µF or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| 8          | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                   |
| 9          | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                  |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 10         | PD0       | I/O      | TTL                      | GPIO port D bit 0.                                                          |
|            | AIN15     | I        | Analog                   | Analog-to-digital converter input 15.                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem flow control input signal.                |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 11         | PD1       | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14     | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                       |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 12         | PD2       | I/O      | TTL                      | GPIO port D bit 2.                                                          |
|            | AIN13     | I        | Analog                   | Analog-to-digital converter input 13.                                       |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S20   | I/O      | TTL                      | EPI module 0 signal 20.                                                     |
|            | PWM2      | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                        |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 13         | PD3       | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12     | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S21   | I/O      | TTL                      | EPI module 0 signal 21.                                                     |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------|
| 14         | PJ0        | I/O      | TTL                      | GPIO port J bit 0.                                                          |
|            | EPI0S16    | I/O      | TTL                      | EPI module 0 signal 16.                                                     |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
| 15         | PH7        | I/O      | TTL                      | GPIO port H bit 7.                                                          |
|            | EPI0S27    | I/O      | TTL                      | EPI module 0 signal 27.                                                     |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Tx     | O        | TTL                      | SSI module 1 transmit.                                                      |
| 16         | PG3        | I/O      | TTL                      | GPIO port G bit 3.                                                          |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                                |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
| 17         | PG2        | I/O      | TTL                      | GPIO port G bit 2.                                                          |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                         |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
| 18         | PG1        | I/O      | TTL                      | GPIO port G bit 1.                                                          |
|            | EPI0S14    | I/O      | TTL                      | EPI module 0 signal 14.                                                     |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                             |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | U2Tx       | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 19         | PG0        | I/O      | TTL                      | GPIO port G bit 0.                                                          |
|            | EPI0S13    | I/O      | TTL                      | EPI module 0 signal 13.                                                     |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 20         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                     |
| 21         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| 22         | PC7        | I/O      | TTL                      | GPIO port C bit 7.                                                          |
|            | C1o        | O        | TTL                      | Analog comparator 1 output.                                                 |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S5     | I/O      | TTL                      | EPI module 0 signal 5.                                                      |
|            | PhB0       | I        | TTL                      | QEI module 0 phase B.                                                       |
|            | U1Tx       | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 23         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                          |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S4   | I/O      | TTL                      | EPI module 0 signal 4.                                                      |
|            | PWM7     | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                        |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                       |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 24         | PC5      | I/O      | TTL                      | GPIO port C bit 5.                                                          |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | C1+      | I        | Analog                   | Analog comparator 1 positive input.                                         |
|            | C1o      | O        | TTL                      | Analog comparator 1 output.                                                 |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S3   | I/O      | TTL                      | EPI module 0 signal 3.                                                      |
|            | Fault2   | I        | TTL                      | PWM Fault 2.                                                                |
| 25         | PC4      | I/O      | TTL                      | GPIO port C bit 4.                                                          |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | EPI0S2   | I/O      | TTL                      | EPI module 0 signal 2.                                                      |
|            | PWM6     | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                        |
|            | PhA0     | I        | TTL                      | QEI module 0 phase A.                                                       |
| 26         | PA0      | I/O      | TTL                      | GPIO port A bit 0.                                                          |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | U0Rx     | I        | TTL                      | UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 27         | PA1      | I/O      | TTL                      | GPIO port A bit 1.                                                          |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                             |
|            | U0Tx     | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 28         | PA2      | I/O      | TTL                      | GPIO port A bit 2.                                                          |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI0Clk  | I/O      | TTL                      | SSI module 0 clock.                                                         |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                  |
|------------|-----------|----------|--------------------------|--------------------------------------------------------------|
| 29         | PA3       | I/O      | TTL                      | GPIO port A bit 3.                                           |
|            | I2S0RXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.              |
|            | PWM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.         |
|            | SSI0Fss   | I/O      | TTL                      | SSI module 0 frame.                                          |
| 30         | PA4       | I/O      | TTL                      | GPIO port A bit 4.                                           |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                        |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                    |
|            | PWM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.         |
|            | SSI0Rx    | I        | TTL                      | SSI module 0 receive.                                        |
| 31         | PA5       | I/O      | TTL                      | GPIO port A bit 5.                                           |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                       |
|            | I2S0TXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.              |
|            | PWM7      | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.         |
|            | SSI0Tx    | O        | TTL                      | SSI module 0 transmit.                                       |
| 32         | VDD       | -        | Power                    | Positive supply for I/O and some logic.                      |
| 33         | GND       | -        | Power                    | Ground reference for logic and I/O pins.                     |
| 34         | PA6       | I/O      | TTL                      | GPIO port A bit 6.                                           |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                        |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                       |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                             |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.         |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.         |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem flow control input signal. |
| 35         | PA7       | I/O      | TTL                      | GPIO port A bit 7.                                           |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                       |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                       |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                       |
|            | I2C1SDA   | I/O      | OD                       | I <sup>2</sup> C module 1 data.                              |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.         |
|            | PWM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.         |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal. |
| 36         | PG7       | I/O      | TTL                      | GPIO port G bit 7.                                           |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                       |
|            | EPI0S31   | I/O      | TTL                      | EPI module 0 signal 31.                                      |
|            | PWM7      | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.         |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                        |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                        |
|------------|------------|----------|--------------------------|----------------------------------------------------------------------------------------------------|
| 37         | PG6        | I/O      | TTL                      | GPIO port G bit 6.                                                                                 |
|            | Fault1     | I        | TTL                      | PWM Fault 1.                                                                                       |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                    |
|------------|----------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 46         | PF5      | I/O      | TTL                      | GPIO port F bit 5.                                                                                                                                                                                                                             |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                                                                                    |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                         |
|            | EPI0S15  | I/O      | TTL                      | EPI module 0 signal 15.                                                                                                                                                                                                                        |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                                                                                                                                                                                         |
| 47         | PF0      | I/O      | TTL                      | GPIO port F bit 0.                                                                                                                                                                                                                             |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                                                                                                                                                                       |
|            | PWM0     | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                                                                                                                                                           |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                                                                                                                                                          |
|            | U1DSR    | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                                                                                                                                                                        |
| 48         | OSC0     | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                                                                                                                                                                            |
| 49         | OSC1     | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                                      |
| 50         | WAKE     | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                               |
| 51         | HIB      | O        | OD                       | An output that indicates the processor is in Hibernate mode.                                                                                                                                                                                   |
| 52         | XOSC0    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register. |
| 53         | XOSC1    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                        |
| 54         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                       |
| 55         | VBAT     | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                               |
| 56         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                        |
| 57         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                       |
| 58         | PF4      | I/O      | TTL                      | GPIO port F bit 4.                                                                                                                                                                                                                             |
|            | C00      | O        | TTL                      | Analog comparator 0 output.                                                                                                                                                                                                                    |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                         |
|            | EPI0S12  | I/O      | TTL                      | EPI module 0 signal 12.                                                                                                                                                                                                                        |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                   |
|            | SSI1Rx   | I        | TTL                      | SSI module 1 receive.                                                                                                                                                                                                                          |
| 59         | PF3      | I/O      | TTL                      | GPIO port F bit 3.                                                                                                                                                                                                                             |
|            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                           |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                           |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                                                                                                                                                                                            |
| 60         | PF2      | I/O      | TTL                      | GPIO port F bit 2.                                                                                                                                                                                                                             |
|            | PWM2     | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                           |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                           |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                                                                                                                                                                                                            |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------|
| 61         | PF1        | I/O      | TTL                      | GPIO port F bit 1.                                                          |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                            |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                         |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem flow control output line.               |
| 62         | PH6        | I/O      | TTL                      | GPIO port H bit 6.                                                          |
|            | EPI0S26    | I/O      | TTL                      | EPI module 0 signal 26.                                                     |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Rx     | I        | TTL                      | SSI module 1 receive.                                                       |
| 63         | PH5        | I/O      | TTL                      | GPIO port H bit 5.                                                          |
|            | EPI0S11    | I/O      | TTL                      | EPI module 0 signal 11.                                                     |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                                |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame.                                                         |
| 64         | RST        | I        | TTL                      | System reset input.                                                         |
| 65         | PB3        | I/O      | TTL                      | GPIO port B bit 3.                                                          |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | Fault3     | I        | TTL                      | PWM Fault 3.                                                                |
|            | I2C0SDA    | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                             |
| 66         | PB0        | I/O      | TTL                      | GPIO port B bit 0. This pin is not 5-V tolerant.                            |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                        |
|            | U1Rx       | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 67         | PB1        | I/O      | TTL                      | GPIO port B bit 1. This pin is not 5-V tolerant.                            |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx       | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 68         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                     |
| 69         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| 70         | USB0DM     | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0.    |
| 71         | USB0DP     | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0.    |
| 72         | PB2        | I/O      | TTL                      | GPIO port B bit 2.                                                          |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | I2C0SCL    | I/O      | OD                       | I <sup>2</sup> C module 0 clock.                                            |
|            | IDX0       | I        | TTL                      | QEI module 0 index.                                                         |
| 73         | USB0RBIAIS | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.    |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                          |
|------------|----------|----------|--------------------------|------------------------------------------------------|
| 74         | PE0      | I/O      | TTL                      | GPIO port E bit 0.                                   |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                               |
|            | EPI0S8   | I/O      | TTL                      | EPI module 0 signal 8.                               |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2. |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                  |
| 75         | PE1      | I/O      | TTL                      | GPIO port E bit 1.                                   |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                               |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                               |
|            | EPI0S9   | I/O      | TTL                      | EPI module 0 signal 9.                               |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                         |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2. |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                  |
| 76         | PH4      | I/O      | TTL                      | GPIO port H bit 4.                                   |
|            | EPI0S10  | I/O      | TTL                      | EPI module 0 signal 10.                              |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                  |
| 77         | PC3      | I/O      | TTL                      | GPIO port C bit 3.                                   |
|            | SW0      | O        | TTL                      | JTAG TDO and SWO.                                    |
|            | TD0      | O        | TTL                      | JTAG TDO and SWO.                                    |
| 78         | PC2      | I/O      | TTL                      | GPIO port C bit 2.                                   |
|            | TDI      | I        | TTL                      | JTAG TDI.                                            |
| 79         | PC1      | I/O      | TTL                      | GPIO port C bit 1.                                   |
|            | SWDIO    | I/O      | TTL                      | JTAG TMS and SWDIO.                                  |
|            | TMS      | I        | TTL                      | JTAG TMS and SWDIO.                                  |
| 80         | PC0      | I/O      | TTL                      | GPIO port C bit 0.                                   |
|            | SWCLK    | I        | TTL                      | JTAG/SWD CLK.                                        |
|            | TCK      | I        | TTL                      | JTAG/SWD CLK.                                        |
| 81         | VDD      | -        | Power                    | Positive supply for I/O and some logic.              |
| 82         | GND      | -        | Power                    | Ground reference for logic and I/O pins.             |
| 83         | PH3      | I/O      | TTL                      | GPIO port H bit 3.                                   |
|            | EPI0S0   | I/O      | TTL                      | EPI module 0 signal 0.                               |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                         |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                |
| 84         | PH2      | I/O      | TTL                      | GPIO port H bit 2.                                   |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                          |
|            | EPI0S1   | I/O      | TTL                      | EPI module 0 signal 1.                               |
|            | Fault3   | I        | TTL                      | PWM Fault 3.                                         |
|            | IDX1     | I        | TTL                      | QEI module 1 index.                                  |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                |
|------------|-----------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 85         | PH1       | I/O      | TTL                      | GPIO port H bit 1.                                                                                                                                                                                                                                                                                                         |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                                                                                                                                                                                                                                                                     |
|            | EPI0S7    | I/O      | TTL                      | EPI module 0 signal 7.                                                                                                                                                                                                                                                                                                     |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                                                       |
|            | PWM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                                                       |

|            | VREFA     | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-26 on page 1209. |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 91         | PB5      | I/O      | TTL                      | GPIO port B bit 5.                                                          |
|            | AIN11    | I        | Analog                   | Analog-to-digital converter input 11.                                       |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                 |

|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                       |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                       |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                      |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|------------|----------|--------------------------|-----------------------------------------------------------------------------|
| 97         | PD4        | I/O      | TTL                      | GPIO port D bit 4.                                                          |
|            | AIN7       | I        | Analog                   | Analog-to-digital converter input 7.                                        |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S19    | I/O      | TTL                      | EPI module 0 signal 19.                                                     |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | U1RI       | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                     |
| 98         | PD5        | I/O      | TTL                      | GPIO port D bit 5.                                                          |
|            | AIN6       | I        | Analog                   | Analog-to-digital converter input 6.                                        |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S28    | I/O      | TTL                      | EPI module 0 signal 28.                                                     |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 99         | PD6        | I/O      | TTL                      | GPIO port D bit 6.                                                          |
|            | AIN5       | I        | Analog                   | Analog-to-digital converter input 5.                                        |
|            | EPI0S29    | I/O      | TTL                      | EPI module 0 signal 29.                                                     |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0TXSCK  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                   |
|            | U2Tx       | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 100        | PD7        | I/O      | TTL                      | GPIO port D bit 7.                                                          |
|            | AIN4       | I        | Analog                   | Analog-to-digital converter input 4.                                        |
|            | C0o        | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | EPI0S30    | I/O      | TTL                      | EPI module 0 signal 30.                                                     |
|            | I2S0TXWS   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | IDX0       | I        | TTL                      | QEI module 0 index.                                                         |
|            | U1DTR      | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-3. Signals by Signal Name

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                          |
|----------|------------|--------------------------|----------|--------------------------|--------------------------------------|
| AIN0     | 1          | PE7                      | I        | Analog                   | Analog-to-digital converter input 0. |
| AIN1     | 2          | PE6                      | I        | Analog                   | Analog-to-digital converter input 1. |
| AIN2     | 5          | PE5                      | I        | Analog                   | Analog-to-digital converter input 2. |
| AIN3     | 6          | PE4                      | I        | Analog                   | Analog-to-digital converter input 3. |
| AIN4     | 100        | PD7                      | I        | Analog                   | Analog-to-digital converter input 4. |
| AIN5     | 99         | PD6                      | I        | Analog                   | Analog-to-digital converter input 5. |
| AIN6     | 98         | PD5                      | I        | Analog                   | Analog-to-digital converter input 6. |

Table 24-3. Signals by Signal Name (continued)

| Pin Name | Pin Number     | Pin Mux / Pin Assignment      | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |
|----------|----------------|-------------------------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX1     | 17<br>61<br>84 | PG2 (8)<br>PF1 (2)<br>PH2 (1) | I        | TTL                      | QE1 module 1 index.                                                                                                                                                                                                                                                                                            |
| LD0      | 7              | fixed                         | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LD0 pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| NMI      | 89             | PB7 (4)                       | I        | TTL                      | Non-maskable interrupt.                                                                                                                                                                                                                                                                                        |

When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                                |
| USB0DM    | 70                                          | fixed                                                          | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0.                                                                                                                                                                                                                                                   |
| USB0DP    | 71                                          | fixed                                                          | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0.                                                                                                                                                                                                                                                   |
| USB0RBIAS | 73                                          | fixed                                                          | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                                                                                   |
| VBAT      | 55                                          | fixed                                                          | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                                                                                           |
| VDD       | 8<br>20<br>32<br>44<br>56<br>68<br>81<br>93 | fixed                                                          | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                    |
| VDDA      | 3                                           | fixed                                                          | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                                        |
| VDDC      | 38<br>88                                    | fixed                                                          | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                                         |
| VREFA     | 90                                          | PB6                                                            | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-26 on page 1209. |

Table 24-3. Signals by Signal Name (continued)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                    |
|----------|------------|--------------------------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WAKE     | 50         | fixed                    | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                               |
| XOSC0    | 52         | fixed                    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register. |
| XOSC1    | 53         | fixed                    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                        |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-4. Signals by Function, Except for GPIO

| Function | Pin Name | Pin Number | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                |
|----------|----------|------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|          | AIN14    | 11         | I        | Analog                   | Analog-to-digital converter input 14.                                                                                                                                                                                                                                                                                      |
|          | AIN15    | 10         | I        | Analog                   | Analog-to-digital converter input 15.                                                                                                                                                                                                                                                                                      |
|          | VREFA    | 90         | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-26 on page 1209. |

Table 24-4. Signals by Function, Except for GPIO (*continued*)

**Table 24-4. Signals by Function, Except for GPIO (continued)**

| Function | Pin Name  | Pin Number                       | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|----------|-----------|----------------------------------|----------|--------------------------|-----------------------------------------------------------------------------|
| UART     | U0Rx      | 26                               | I        | TTL                      | UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.  |
|          | U0Tx      | 27                               | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation. |
|          | U1CTS     | 2<br>10<br>34                    | I        | TTL                      | UART module 1 Clear To Send modem flow control input signal.                |
|          | U1DCD     | 1<br>11<br>35                    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|          | U1DSR     | 47                               | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                     |
|          | U1DTR     | 40<br>100                        | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                |
|          | U1RI      | 37<br>41<br>97                   | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                     |
|          | U1RTS     | 43<br>61                         | O        | TTL                      | UART module 1 Request to Send modem flow control output line.               |
|          | U1Rx      | 10<br>12<br>23<br>26<br>66<br>92 | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|          | U1Tx      | 11<br>13<br>22<br>27<br>67<br>91 | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|          | U2Rx      | 10<br>19<br>92<br>98             | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
|          | U2Tx      | 6<br>11<br>18<br>99              | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| USB      | USB0DM    | 70                               | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0.    |
|          | USB0DP    | 71                               | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0.    |
|          | USB0RBIAS | 73                               | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.    |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

**Table 24-5. GPIO Pins and Alternate Functions**

| IO  | Pin | Analog Function | Digital Function (GPIOCTL PMCx Bit Field Encoding) <sup>a</sup> |   |   |   |   |   |   |         |      |    |    |

|            | VREFA     | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-26 on page 1209. |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| A12        | PE1      | I/O      | TTL                      | GPIO port E bit 1.                                                          |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S9   | I/O      | TTL                      | EPI module 0 signal 9.                                                      |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                         |
| B1         | PE7      | I/O      | TTL                      | GPIO port E bit 7.                                                          |
|            | AIN0     | I        | Analog                   | Analog-to-digital converter input 0.                                        |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
| B2         | PE4      | I/O      | TTL                      | GPIO port E bit 4.                                                          |
|            | AIN3     | I        | Analog                   | Analog-to-digital converter input 3.                                        |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| B3         | PE5      | I/O      | TTL                      | GPIO port E bit 5.                                                          |
|            | AIN2     | I        | Analog                   | Analog-to-digital converter input 2.                                        |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                    |
| B4         | PE3      | I/O      | TTL                      | GPIO port E bit 3.                                                          |
|            | AIN8     | I        | Analog                   | Analog-to-digital converter input 8.                                        |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | CCP7     | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S25  | I/O      | TTL                      | EPI module 0 signal 25.                                                     |
|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                       |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                       |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                      |
| B5         | PD4      | I/O      | TTL                      | GPIO port D bit 4.                                                          |
|            | AIN7     | I        | Analog                   | Analog-to-digital converter input 7.                                        |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S19  | I/O      | TTL                      | EPI module 0 signal 19.                                                     |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                     |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                     |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                        |
|------------|-----------|----------|--------------------------|----------------------------------------------------------------------------------------------------|
| B6         | PJ1       | I/O      | TTL                      | GPIO port J bit 1.                                                                                 |
|            | EPI0S17   | I/O      | TTL                      | EPI module 0 signal 17.                                                                            |
|            | I2C1SDA   | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                    |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                               |
| B7         | PB5       | I/O      | TTL                      | GPIO port B bit 5.                                                                                 |
|            | AIN11     | I        | Analog                   | Analog-to-digital converter input 11.                                                              |
|            | C0o       | O        | TTL                      | Analog comparator 0 output.                                                                        |
|            | C1-       | I        | Analog                   | Analog comparator 1 negative input.                                                                |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                                             |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                             |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                             |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                             |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                             |
|            | EPI0S22   | I/O      | TTL                      | EPI module 0 signal 22.                                                                            |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                        |
| B8         | PC2       | I/O      | TTL                      | GPIO port C bit 2.                                                                                 |
|            | TDI       | I        | TTL                      | JTAG TDI.                                                                                          |
| B9         | PC1       | I/O      | TTL                      | GPIO port C bit 1.                                                                                 |
|            | SWDIO     | I/O      | TTL                      | JTAG TMS and SWDIO.                                                                                |
|            | TMS       | I        | TTL                      | JTAG TMS and SWDIO.                                                                                |
| B10        | PH4       | I/O      | TTL                      | GPIO port H bit 4.                                                                                 |
|            | EPI0S10   | I/O      | TTL                      | EPI module 0 signal 10.                                                                            |
|            | SSI1Clk   | I/O      | TTL                      | SSI module 1 clock.                                                                                |
| B11        | PE0       | I/O      | TTL                      | GPIO port E bit 0.                                                                                 |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                             |
|            | EPI0S8    | I/O      | TTL                      | EPI module 0 signal 8.                                                                             |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                               |
|            | SSI1Clk   | I/O      | TTL                      | SSI module 1 clock.                                                                                |
| B12        | USB0RBIAS | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                           |
| C1         | NC        | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                       |
| C2         | NC        | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                       |
| C3         | VDDC      | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. |
| C4         | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                           |
| C5         | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                           |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                         |
|------------|-----------|----------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C6         | PD5       | I/O      | TTL                      | GPIO port D bit 5.                                                                                                                                                                                                                                                                  |
|            | AIN6      | I        | Analog                   | Analog-to-digital converter input 6.                                                                                                                                                                                                                                                |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                              |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                                                                                                                                                                                              |
|            | EPI0S28   | I/O      | TTL                      | EPI module 0 signal 28.                                                                                                                                                                                                                                                             |
|            | I2S0RXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                                                                                                                                                                                                     |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                          |
| C7         | VDDA      | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation. |
| C8         | PH1       | I/O      | TTL                      | GPIO port H bit 1.                                                                                                                                                                                                                                                                  |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                                                                                                                                                                                                                              |
|            | EPI0S7    | I/O      | TTL                      | EPI module 0 signal 7.                                                                                                                                                                                                                                                              |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                |
|            | PWM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                |
| C9         | PH0       | I/O      | TTL                      | GPIO port H bit 0.                                                                                                                                                                                                                                                                  |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                                                                                                                                                                                              |

|            | Fault2   | I        | TTL                      | PWM Fault 2.                                                                                                                                                                                                                                                                                                   |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                                                                                                                                                                                                                                                            |
| F11        | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |
| F12        | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| G1         | PD0       | I/O      | TTL                      | GPIO port D bit 0.                                                          |
|            | AIN15     | I        | Analog                   | Analog-to-digital converter input 15.                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem flow control input signal.                |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| G2         | PD1       | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14     | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                       |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| G3         | PH6       | I/O      | TTL                      | GPIO port H bit 6.                                                          |
|            | EPI0S26   | I/O      | TTL                      | EPI module 0 signal 26.                                                     |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Rx    | I        | TTL                      | SSI module 1 receive.                                                       |
| G10        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |
| G11        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |
| G12        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                     |
| H1         | PD3       | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12     | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S21   | I/O      | TTL                      | EPI module 0 signal 21.                                                     |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                |
|------------|------------|----------|--------------------------|----------------------------------------------------------------------------|
| H2         | PD2        | I/O      | TTL                      | GPIO port D bit 2.                                                         |
|            | AIN13      | I        | Analog                   | Analog-to-digital converter input 13.                                      |
|            | CCP5       | I/O      | TTL                      | Capture/Compare/PWM 5.                                                     |
|            | CCP6       | I/O      | TTL                      | Capture/Compare/PWM 6.                                                     |
|            | EPI0S20    | I/O      | TTL                      | EPI module 0 signal 20.                                                    |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                       |
|            | U1Rx       | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation. |
| H3         | PH7        | I/O      | TTL                      | GPIO port H bit 7.                                                         |
|            | EPI0S27    | I/O      | TTL                      | EPI module 0 signal 27.                                                    |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                       |
|            | SSI1Tx     | O        | TTL                      | SSI module 1 transmit.                                                     |
| H10        | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                    |
| H11        | RST        | I        | TTL                      | System reset input.                                                        |
| H12        | PF1        | I/O      | TTL                      | GPIO port F bit 1.                                                         |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                     |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                           |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                        |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                       |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem flow control output line.              |
| J1         | PG2        | I/O      | TTL                      | GPIO port G bit 2.                                                         |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                               |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                    |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                        |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                       |
| J2         | PG3        | I/O      | TTL                      | GPIO port G bit 3.                                                         |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                               |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                               |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                            |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                       |
| J3         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                   |
| J10        | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                   |
| J11        | PF2        | I/O      | TTL                      | GPIO port F bit 2.                                                         |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                       |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                       |
|            | SSI1Clk    | I/O      | TTL                      | SSI module 1 clock.                                                        |
| J12        | PF3        | I/O      | TTL                      | GPIO port F bit 3.                                                         |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                       |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                       |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame.                                                        |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                    |
|------------|----------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| K1         | PG0      | I/O      | TTL                      | GPIO port G bit 0.                                                                                                                                                                                                                             |
|            | EPI0S13  | I/O      | TTL                      | EPI module 0 signal 13.                                                                                                                                                                                                                        |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                                                                                                                                                               |
|            | PWM0     | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                                                                                                                                                           |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                           |
|            | U2Rx     | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                     |
| K2         | PG1      | I/O      | TTL                      | GPIO port G bit 1.                                                                                                                                                                                                                             |
|            | EPI0S14  | I/O      | TTL                      | EPI module 0 signal 14.                                                                                                                                                                                                                        |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                                                                                                                                                                |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                                                                                                                                                           |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                           |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                    |
| K3         | PG4      | I/O      | TTL                      | GPIO port G bit 4.                                                                                                                                                                                                                             |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                                                                                         |
|            | EPI0S15  | I/O      | TTL                      | EPI module 0 signal 15.                                                                                                                                                                                                                        |
|            | Fault1   | I        | TTL                      | PWM Fault 1.                                                                                                                                                                                                                                   |
|            | PWM6     | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                                                                                                                                                           |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                                                                                                                                                        |
| K4         | PF7      | I/O      | TTL                      | GPIO port F bit 7.                                                                                                                                                                                                                             |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                                                                                                                                                         |
|            | EPI0S12  | I/O      | TTL                      | EPI module 0 signal 12.                                                                                                                                                                                                                        |

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                      |
|------------|----------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| L7         | PG6      | I/O      | TTL                      | GPIO port G bit 6.                                                                                                                                                               |
|            | Fault1   | I        | TTL                      | PWM Fault 1.                                                                                                                                                                     |
|            | I2S0RXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                                                                                                                                   |
|            | PWM6     | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                                                                                             |
|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                                                                                                                            |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                                                                                          |
| L8         | PF5      | I/O      | TTL                      | GPIO port F bit 5.                                                                                                                                                               |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                           |
|            | EPI0S15  | I/O      | TTL                      | EPI module 0 signal 15.                                                                                                                                                          |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                                                                                                                           |
| L9         | PF4      | I/O      | TTL                      | GPIO port F bit 4.                                                                                                                                                               |
|            | C00      | O        | TTL                      | Analog comparator 0 output.                                                                                                                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                           |
|            | EPI0S12  | I/O      | TTL                      | EPI module 0 signal 12.                                                                                                                                                          |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                     |
|            | SSI1Rx   | I        | TTL                      | SSI module 1 receive.                                                                                                                                                            |
| L10        | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                         |
| L11        | OSC0     | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                                                                                                              |
| L12        | VBAT     | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply. |
| M1         | PC5      | I/O      | TTL                      | GPIO port C bit 5.                                                                                                                                                               |
|            | C00      | O        | TTL                      | Analog comparator 0 output.                                                                                                                                                      |
|            | C1+      | I        | Analog                   | Analog comparator 1 positive input.                                                                                                                                              |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                      |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                                                                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                           |
|            | EPI0S3   | I/O      | TTL                      | EPI module 0 signal 3.                                                                                                                                                           |
|            | Fault2   | I        | TTL                      | PWM Fault 2.                                                                                                                                                                     |
| M2         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                                                                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                           |
|            | EPI0S4   | I/O      | TTL                      | EPI module 0 signal 4.                                                                                                                                                           |
|            | PWM7     | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                                                                                             |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                                                                                            |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                       |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                      |
|------------|------------|----------|--------------------------|----------------------------------------------------------------------------------|
| M3         | PA1        | I/O      | TTL                      | GPIO port A bit 1.                                                               |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                  |
|            | U0Tx       | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.      |
|            | U1Tx       | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.      |
| M4         | PA2        | I/O      | TTL                      | GPIO port A bit 2.                                                               |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                          |

|            | U1DTR      | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                     |
| M8         | PF6        | I/O      | TTL                      | GPIO port F bit 6.                                                               |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                           |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                                 |
|            | PhA0       | I        | TTL                      | QEI module 0 phase A.                                                            |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem flow control output line.                    |
| M9         | PF0        | I/O      | TTL                      | GPIO port F bit 0.                                                               |
|            | I2S0TXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                         |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                             |
|            | PhB0       | I        | TTL                      | QEI module 0 phase B.                                                            |
|            | U1DSR      | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                          |
| M10        | WAKE       | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted. |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                               |
|------------|----------|----------|--------------------------|-------------------------------------------------------------------------------------------|
| M11        | OSC1     | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source. |
| M12        | HIB      | O        | OD                       | An output that indicates the processor is in Hibernate mode.                              |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-8. Signals by Signal Name

| Pin Name | Pin Number                  | Pin Mux / Pin Assignment                            | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|-----------------------------|-----------------------------------------------------|----------|--------------------------|---------------------------------------|
| AIN0     | B1                          | PE7                                                 | I        | Analog                   | Analog-to-digital converter input 0.  |
| AIN1     | A1                          | PE6                                                 | I        | Analog                   | Analog-to-digital converter input 1.  |
| AIN2     | B3                          | PE5                                                 | I        | Analog                   | Analog-to-digital converter input 2.  |
| AIN3     | B2                          | PE4                                                 | I        | Analog                   | Analog-to-digital converter input 3.  |
| AIN4     | A2                          | PD7                                                 | I        | Analog                   | Analog-to-digital converter input 4.  |
| AIN5     | A3                          | PD6                                                 | I        | Analog                   | Analog-to-digital converter input 5.  |
| AIN6     | C6                          | PD5                                                 | I        | Analog                   | Analog-to-digital converter input 6.  |
| AIN7     | B5                          | PD4                                                 | I        | Analog                   | Analog-to-digital converter input 7.  |
| AIN8     | B4                          | PE3                                                 | I        | Analog                   | Analog-to-digital converter input 8.  |
| AIN9     | A4                          | PE2                                                 | I        | Analog                   | Analog-to-digital converter input 9.  |
| AIN10    | A6                          | PB4                                                 | I        | Analog                   | Analog-to-digital converter input 10. |
| AIN11    | B7                          | PB5                                                 | I        | Analog                   | Analog-to-digital converter input 11. |
| AIN12    | H1                          | PD3                                                 | I        | Analog                   | Analog-to-digital converter input 12. |
| AIN13    | H2                          | PD2                                                 | I        | Analog                   | Analog-to-digital converter input 13. |
| AIN14    | G2                          | PD1                                                 | I        | Analog                   | Analog-to-digital converter input 14. |

| VDDA     | C7                                                | fixed                    | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                                        |
| VDDC     | D3<br>C3                                          | fixed                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                                         |
| VREFA    | A7                                                | PB6                      | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-26 on page 1209. |
| WAKE     | M10                                               | fixed                    | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                                                                                                           |
| XOSC0    | K11                                               | fixed                    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.                                                                             |
| XOSC1    | K12                                               | fixed                    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                                                                                                    |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-9. Signals by Function, Except for GPIO

| Function                | Pin Name | Pin Number                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                |

|                         | VREFA    | A7                          | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-26 on page 1209. |

This signal is controlled by PWM Generator 3.                                                                                                                                                                                                                                                           |
|          | PWM7     | M2<br>M5<br>C10<br>M7                                   | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                                                                                                                                                                                                                           |
| Power    | GND      | C4<br>C5<br>J3<br>K5<br>L10<br>K10<br>J10<br>F11<br>F12 | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |
|          | GNDA     | A5                                                      | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                              |
|          | LD0      | E3                                                      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LD0 pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
|          | VDD      | K7<br>G12<br>K8<br>K9<br>H10<br>G10<br>E10<br>G11       | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
|          | VDDA     | C7                                                      | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                            |
|          | VDDC     | D3<br>C3                                                | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                             |

## 24.3 Connections for Unused Signals

Table 24-12 on page 1189 show how to handle signals for functions that are not used in a particular system implementation for devices that are in a 100-pin LQFP package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

Table 24-12. Connections for Unused Signals (100-Pin LQFP)

| Function       | Signal Name      | Pin Number | Acceptable Practice                        | Preferred Practice                                             |
|----------------|------------------|------------|--------------------------------------------|----------------------------------------------------------------|
| GPIO           | All unused GPIOs | -          | NC                                         | GND                                                            |
| Hibernate      | HTB              | 51         | NC                                         | NC                                                             |

## 25 Operating Characteristics

**Table 25-1. Temperature Characteristics**

| Characteristic                         | Symbol | Value       | Unit |
|----------------------------------------|--------|-------------|------|
| Industrial operating temperature range | $T_A$  | -40 to +85  | °C   |
| Unpowered storage temperature range    | $T_S$  | -65 to +150 | °C   |

**Table 25-2. Thermal Characteristics**

| Characteristic                                        | Symbol        | Value                         | Unit |
|-------------------------------------------------------|---------------|-------------------------------|------|
| Thermal resistance (junction to ambient) <sup>a</sup> | $\Theta_{JA}$ | 35 (100LQFP)<br>33 (108BGA)   | °C/W |
| Junction temperature, -40 to +125 <sup>b</sup>        | $T_J$         | $T_A + (P \cdot \Theta_{JA})$ | °C   |

a. Junction to ambient thermal resistance  $\Theta_{JA}$  numbers are determined by a package simulator.

b. Power dissipation is a function of temperature.

**Table 25-3. ESD Absolute Maximum Ratings<sup>a</sup>**

| Parameter Name | Min | Nom | Max | Unit |
|----------------|-----|-----|-----|------|
| $V_{ESDHBM}$   | -   | -   | 2.0 | kV   |
| $V_{ESDCDM}$   | -   | -   | 500 | V    |

a. All Stellaris® parts are ESD tested following the JEDEC standard.

## 26 Electrical Characteristics

### 26.1 Maximum Ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device.

**Note:** The device is not guaranteed to operate properly at the maximum ratings.

**Table 26-1. Maximum Ratings**

| Parameter        | Parameter Name <sup>a</sup>                                                    | Value |                       | Unit |
|------------------|--------------------------------------------------------------------------------|-------|-----------------------|------|
|                  |                                                                                | Min   | Max                   |      |
| V <sub>DD</sub>  | V <sub>DD</sub> supply voltage                                                 | 0     | 4                     | V    |
| V <sub>DDA</sub> | V <sub>DDA</sub> supply voltage                                                | 0     | 4                     | V    |
| V <sub>BAT</sub> | V <sub>BAT</sub> battery supply voltage                                        | 0     | 4                     | V    |
| V <sub>IN</sub>  | Input voltage                                                                  | -0.3  | 5.5                   | V    |
|                  | Input voltage for a GPIO configured as an analog input                         | -0.3  | V <sub>DD</sub> + 0.3 | V    |
|                  | Input voltage for PB0 and PB1 when configured as GPIO                          | -0.3  | V <sub>DD</sub> + 0.3 | V    |
| I                | Maximum current per output pin                                                 | -     | 25                    | mA   |
| V <sub>NON</sub> | Maximum input voltage on a non-power pin when the microcontroller is unpowered | -     | 300                   | mV   |

a. Voltages are measured with respect to GND.

**Important:** This device contains circuitry to protect the inputs against damage due to high-static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (see “Connections for Unused Signals” on page 1189).

### 26.2 Recommended Operating Conditions

For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs may be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the V<sub>OL</sub> value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are only a maximum of two per side of the physical package or BGA pin group with the total number of high-current GPIO outputs not exceeding four for the entire package.

**Table 26-2. Recommended DC Operating Conditions**

| Parameter                    | Parameter Name                  | Min   | Nom | Max   | Unit |
|------------------------------|---------------------------------|-------|-----|-------|------|
| V <sub>DD</sub>              | V <sub>DD</sub> supply voltage  | 3.0   | 3.3 | 3.6   | V    |
| V <sub>DDA</sub>             | V <sub>DDA</sub> supply voltage | 3.0   | 3.3 | 3.6   | V    |
| V <sub>DDC</sub>             | V <sub>DDC</sub> supply voltage | 1.235 | 1.3 | 1.365 | V    |
| V <sub>IH</sub>              | High-level input voltage        | 2.1   | -   | 5.0   | V    |
| V <sub>IL</sub>              | Low-level input voltage         | -0.3  | -   | 1.2   | V    |
| V <sub>OH</sub> <sup>a</sup> | High-level output voltage       | 2.4   | -   | -     | V    |

**Table 26-2. Recommended DC Operating Conditions (continued)**

| Parameter  | Parameter Name                            | Min | Nom | Max | Unit |
|------------|-------------------------------------------|-----|-----|-----|------|
| $V_{OL}^a$ | Low-level output voltage                  | -   | -   | 0.4 | V    |
| $I_{OH}$   | High-level source current, $V_{OH}=2.4$ V |     |     |     |      |
|            | 2-mA Drive                                | 2.0 | -   | -   | mA   |
|            | 4-mA Drive                                | 4.0 | -   | -   | mA   |
|            | 8-mA Drive                                | 8.0 | -   | -   | mA   |
| $I_{OL}$   | Low-level sink current, $V_{OL}=0.4$ V    |     |     |     |      |
|            | 2-mA Drive                                | 2.0 | -   | -   | mA   |
|            | 4-mA Drive                                | 4.0 | -   | -   | mA   |
|            | 8-mA Drive                                | 8.0 | -   | -   | mA   |
| $I_{OHC}$  | High-current sink, $V_{OL}=1.2$ V         | 18  | -   | -   | mA   |

a.  $V_{OL}$  and  $V_{OH}$  shift to 1.2 V when using high-current GPIOs.

## 26.3 Load Conditions

Unless otherwise specified, the following conditions are true for all timing measurements.

**Figure 26-1. Load Conditions**

## 26.4 JTAG and Boundary Scan

**Table 26-3. JTAG Characteristics**

| Parameter No. | Parameter       | Parameter Name                               | Min | Nom       | Max | Unit |
|---------------|-----------------|----------------------------------------------|-----|-----------|-----|------|
| J1            | $F_{TCK}$       | TCK operational clock frequency <sup>a</sup> | 0   | -         | 10  | MHz  |
| J2            | $T_{TCK}$       | TCK operational clock period                 | 100 | -         | -   | ns   |
| J3            | $T_{TCK\_LOW}$  | TCK clock Low time                           | -   | $t_{TCK}$ | -   | ns   |
| J4            | $T_{TCK\_HIGH}$ | TCK clock High time                          | -   | $t_{TCK}$ | -   | ns   |
| J5            | $T_{TCK\_R}$    | TCK rise time                                | 0   | -         | 10  | ns   |
| J6            | $T_{TCK\_F}$    | TCK fall time                                | 0   | -         | 10  | ns   |
| J7            | $T_{TMS\_SU}$   | TMS setup time to TCK rise                   | 20  | -         | -   | ns   |
| J8            | $T_{TMS\_HLD}$  | TMS hold time from TCK rise                  | 20  | -         | -   | ns   |
| J9            | $T_{TDI\_SU}$   | TDI setup time to TCK rise                   | 25  | -         | -   | ns   |
| J10           | $T_{TDI\_HLD}$  | TDI hold time from TCK rise                  | 25  | -         | -   | ns   |

Table 26-3. JTAG Characteristics (*continued*)

| Parameter No. | Parameter      | Parameter Name                                                            | Min | Nom | Max | Unit |
|---------------|----------------|---------------------------------------------------------------------------|-----|-----|-----|------|
| J11           | $T_{TDO\_ZDV}$ | TCK fall to Data Valid from High-Z, 2-mA drive                            | -   | 23  | 35  | ns   |
|               |                | TCK fall to Data Valid from High-Z, 4-mA drive                            |     | 15  | 26  | ns   |
|               |                | TCK fall to Data Valid from High-Z, 8-mA drive                            |     | 14  | 25  | ns   |
|               |                | TCK fall to Data Valid from High-Z, 8-mA drive with slew rate control     |     | 18  | 29  | ns   |
| J12           | $T_{TDO\_DV}$  | TCK fall to Data Valid from Data Valid, 2-mA drive                        | -   | 21  | 35  | ns   |
|               |                | TCK fall to Data Valid from Data Valid, 4-mA drive                        |     | 14  | 25  | ns   |
|               |                | TCK fall to Data Valid from Data Valid, 8-mA drive                        |     | 13  | 24  | ns   |
|               |                | TCK fall to Data Valid from Data Valid, 8-mA drive with slew rate control |     | 18  | 28  | ns   |
| J13           | $T_{TDO\_DVZ}$ | TCK fall to High-Z from Data Valid, 2-mA drive                            | -   | 9   | 11  | ns   |
|               |                | TCK fall to High-Z from Data Valid, 4-mA drive                            |     | 7   | 9   | ns   |
|               |                | TCK fall to High-Z from Data Valid, 8-mA drive                            |     | 6   | 8   | ns   |
|               |                | TCK fall to High-Z from Data Valid, 8-mA drive with slew rate control     |     | 7   | 9   | ns   |

a. A ratio of at least 8:1 must be kept between the system clock and TCK.

## 26.7 On-Chip Low Drop-Out (LDO) Regulator

**Table 26-6. LDO Regulator Characteristics**

| Parameter | Parameter Name                                           | Min   | Nom | Max   | Unit          |
|-----------|----------------------------------------------------------|-------|-----|-------|---------------|
| $C_{LDO}$ | External filter capacitor size for internal power supply | 1.0   | -   | 3.0   | $\mu\text{F}$ |
| $V_{LDO}$ | LDO output voltage                                       | 1.235 | 1.3 | 1.365 | V             |

## 26.8 Clocks

The following sections provide specifications on the various clock sources and mode.

### 26.8.1 PLL Specifications

The following tables provide specifications for using the PLL.

**Table 26-7. Phase Locked Loop (PLL) Characteristics**

| Parameter       | Parameter Name                        | Min                | Nom | Max               | Unit |
|-----------------|---------------------------------------|--------------------|-----|-------------------|------|
| $F_{REF\_XTAL}$ | Crystal reference <sup>a</sup>        | 3.579545           | -   | 16.384            | MHz  |
| $F_{REF\_EXT}$  | External clock reference <sup>a</sup> | 3.579545           | -   | 16.384            | MHz  |
| $F_{PLL}$       | PLL frequency <sup>b</sup>            | -                  | 400 | -                 | MHz  |
| $T_{READY}$     | PLL lock time                         | 0.562 <sup>c</sup> | -   | 1.38 <sup>d</sup> | ms   |

a. The exact value is determined by the crystal value programmed into the XTAL field of the **Run-Mode Clock Configuration (RCC)** register.

b. PLL frequency is automatically calculated by the hardware based on the XTAL field of the **RCC** register.

c. Using a 16.384-MHz crystal

d. Using 3.5795-MHz crystal

Table 26-8 on page 1198 shows the actual frequency of the PLL based on the crystal frequency used (defined by the XTAL field in the **RCC** register).

Table 26-8. Actual PLL Frequency

| XTAL | Crystal Frequency (MHz) | PLL Frequency (MHz) | Error   |
|------|-------------------------|---------------------|---------|
| 0x04 | 3.5795                  | 400.904             | 0.0023% |
| 0x05 | 3.6864                  | 398.1312            | 0.0047% |
| 0x06 | 4.0                     | 400                 | -       |
| 0x07 | 4.096                   | 401.408             | 0.0035% |
| 0x08 | 4.9152                  | 398.1312            | 0.0047% |

## 26.8.2 PIOSC Specifications

Table 26-9. PIOSC Clock Characteristics

| Parameter              | Parameter Name                                                                                                           | Min | Nom    | Max | Unit |
|------------------------|--------------------------------------------------------------------------------------------------------------------------|-----|--------|-----|------|
| F <sub>PIOSC25</sub>   | Internal 16-MHz precision oscillator frequency variance, factory calibrated at 25 °C                                     | -   | ±0.25% | ±1% | -    |
| F <sub>PIOSCT</sub>    | Internal 16-MHz precision oscillator frequency variance, factory calibrated at 25 °C, across specified temperature range | -   | -      | ±3% | -    |
| F <sub>PIOSCUCAL</sub> | Internal 16-MHz precision oscillator frequency variance, user calibrated at a chosen temperature                         | -   | ±0.25% | ±1% | -    |

## 26.8.3 Internal 30-kHz Oscillator Specifications

Table 26-10. 30-kHz Clock Characteristics

| Parameter              | Parameter Name                       | Min | Nom | Max | Unit |
|------------------------|--------------------------------------|-----|-----|-----|------|
| F <sub>IOSC30KHZ</sub> | Internal 30-KHz oscillator frequency | 15  | 30  | 45  | KHz  |

## 26.8.4 Hibernation Clock Source Specifications

Table 26-11. Hibernation Clock Characteristics

| Parameter                | Parameter Name                               | Min | Nom      | Max | Unit |
|--------------------------|----------------------------------------------|-----|----------|-----|------|
| F <sub>HIBOSC</sub>      | Hibernation module oscillator frequency      | -   | 4.194304 | -   | MHz  |
| F <sub>HIBOSC_XTAL</sub> | Crystal reference for hibernation oscillator | -   | 4.194304 | -   | MHz  |

**Table 26-11. Hibernation Clock Characteristics (continued)**

| Parameter                 | Parameter Name                                   | Min | Nom    | Max | Unit |
|---------------------------|--------------------------------------------------|-----|--------|-----|------|
| T <sub>HIBOSC_START</sub> | Hibernation oscillator startup time <sup>a</sup> | -   | -      | 10  | ms   |
| F <sub>HIBOSC_EXT</sub>   | External clock reference for hibernation module  | -   | 32.768 | -   | KHz  |
| DC <sub>HIBOSC_EXT</sub>  | External clock reference duty cycle              | 45  | -      | 55  | %    |

a. This parameter is highly sensitive to PCB layout and trace lengths, which may make this parameter time longer. Care must be taken in PCB design to minimize trace lengths and RLC (resistance, inductance, capacitance).

**Table 26-12. HIB Oscillator Input Characteristics**

| Parameter             | Parameter Name                             | Min | Nom                                          | Max | Unit |
|-----------------------|--------------------------------------------|-----|----------------------------------------------|-----|------|
| F <sub>HIBOSC</sub>   | Hibernation module oscillator frequency    | -   | 4.194304                                     | -   | MHz  |
| TOL <sub>HIBOSC</sub> | Hibernation oscillator frequency tolerance | -   | Defined by customer application requirements | -   | PPM  |

## 26.8.5 Main Oscillator Specifications

**Table 26-13. Main Oscillator Clock Characteristics**

| Parameter                    | Parameter Name                                                                | Min  | Nom | Max    | Unit |
|------------------------------|-------------------------------------------------------------------------------|------|-----|--------|------|
| F <sub>MOSC</sub>            | Main oscillator frequency                                                     | 1    | -   | 16.384 | MHz  |
| T <sub>MOSC_PER</sub>        | Main oscillator period                                                        | 61   | -   | 1000   | ns   |
| T <sub>MOSC_SETTLE</sub>     | Main oscillator settling time <sup>a</sup>                                    | 17.5 | -   | 20     | ms   |
| T <sub>REF_XTAL_BYPASS</sub> | Crystal reference using the main oscillator (PLL in BYPASS mode) <sup>b</sup> | 1    | -   | 16.384 | MHz  |
| F <sub>REF_EXT_BYPASS</sub>  | External clock reference (PLL in BYPASS mode) <sup>b</sup>                    | 0    | -   | 50     | MHz  |
| DC <sub>MOSC_EXT</sub>       | External clock reference duty cycle                                           | 45   | -   | 55     | %    |

a. This parameter is highly sensitive to PCB layout and trace lengths, which may make this parameter time longer. Care must be taken in PCB design to minimize trace lengths and RLC (resistance, inductance, capacitance).

b. If the ADC is used, the crystal reference must be 16 MHz ± .03% when the PLL is bypassed.

**Table 26-14. Supported MOSC Crystal Frequencies<sup>a</sup>**

| Crystal Frequency (MHz) Not Using the PLL | Crystal Frequency (MHz) Using the PLL |
|-------------------------------------------|---------------------------------------|
| 1.000 MHz                                 | reserved                              |
| 1.8432 MHz                                | reserved                              |
| 2.000 MHz                                 | reserved                              |
| 2.4576 MHz                                | reserved                              |
| 3.579545 MHz                              |                                       |
| 3.6864 MHz                                |                                       |
| 4 MHz (USB)                               |                                       |
| 4.096 MHz                                 |                                       |
| 4.9152 MHz                                |                                       |
| 5 MHz (USB)                               |                                       |
| 5.12 MHz                                  |                                       |
| 6 MHz (reset value)(USB)                  |                                       |

Table 26-14. Supported MOSC Crystal Frequencies (continued)

| Crystal Frequency (MHz) Not Using the PLL | Crystal Frequency (MHz) Using the PLL |
|-------------------------------------------|---------------------------------------|
| 6.144 MHz                                 |                                       |
| 7.3728 MHz                                |                                       |
| 8 MHz (USB)                               |                                       |
| 8.192 MHz                                 |                                       |
| 10.0 MHz (USB)                            |                                       |
| 12.0 MHz (USB)                            |                                       |
| 12.288 MHz                                |                                       |
| 13.56 MHz                                 |                                       |
| 14.31818 MHz                              |                                       |
| 16.0 MHz (USB)                            |                                       |
| 16.384 MHz                                |                                       |

a. Frequencies that may be used with the USB interface are indicated in the table.

## 26.8.6 System Clock Specification with ADC Operation

Table 26-15. System Clock Characteristics with ADC Operation

| Parameter           | Parameter Name                                                                 | Min     | Nom | Max     | Unit |
|---------------------|--------------------------------------------------------------------------------|---------|-----|---------|------|
| F <sub>sysadc</sub> | System clock frequency when the ADC module is operating (when PLL is bypassed) | 15.9952 | 16  | 16.0048 | MHz  |

## 26.9 Sleep Modes

Table 26-16. Sleep Modes AC Characteristics<sup>a</sup>

| Parameter No | Parameter               | Parameter Name                                                             | Min | Nom | Max                | Unit          |
|--------------|-------------------------|----------------------------------------------------------------------------|-----|-----|--------------------|---------------|
| D1           | T <sub>WAKE_S</sub>     | Time to wake from interrupt in sleep or deep-sleep mode, not using the PLL | -   | -   | 7                  | system clocks |
| D2           | T <sub>WAKE_PLL_S</sub> | Time to wake from interrupt in sleep or deep-sleep mode when using the PLL | -   | -   | T <sub>READY</sub> | ms            |
| D3           | T <sub>ENTER_DS</sub>   | Time to enter deep-sleep mode from sleep request                           | -   | 0   | 35 <sup>b</sup>    | ms            |

a. Values in this table assume the IOSC is the clock source during sleep or deep-sleep mode.

b. Nominal specification occurs 99.9995% of the time.

## 26.10 Hibernation Module

The Hibernation module requires special system implementation considerations because it is intended to power down all other sections of its host device, refer to “Hibernation Module” on page 301.

Table 26-17. Hibernation Module Battery Characteristics

| Parameter           | Parameter Name             | Min | Nominal | Max | Unit |
|---------------------|----------------------------|-----|---------|-----|------|
| V <sub>BAT</sub>    | Battery supply voltage     | 2.4 | 3.0     | 3.6 | V    |
| V <sub>LOWBAT</sub> | Low battery detect voltage | 1.8 | -       | 2.2 | V    |

**Table 26-18. Hibernation Module AC Characteristics**

| Parameter No | Parameter              | Parameter Name                                                                                                       | Min | Nom | Max             | Unit    |
|--------------|------------------------|----------------------------------------------------------------------------------------------------------------------|-----|-----|-----------------|---------|
| H1           | $T_{HIB\_LOW}$         | Internal 32.768 KHz clock reference rising edge to HIB asserted                                                      | 20  | -   | -               | $\mu s$ |
| H2           | $T_{HIB\_HIGH}$        | Internal 32.768 KHz clock reference rising edge to HIB deasserted                                                    | -   | 30  | -               | $\mu s$ |
| H3           | $T_{WAKE\_TO\_HIB}$    | WAKE assert to HIB desassert (wake up time), internal Hibernation oscillator running during hibernation <sup>a</sup> | 62  | -   | 124             | $\mu s$ |
| H4           | $T_{WAKE\_TO\_HIB}$    | WAKE assert to HIB desassert (wake up time), internal Hibernation oscillator stopped during hibernation <sup>a</sup> | -   | -   | 10              | ms      |
| H5           | $T_{WAKE\_CLOCK}$      | WAKE assertion time, internal Hibernation oscillator running during hibernation                                      | 62  | -   | -               | $\mu s$ |
| H6           | $T_{WAKE\_NOCLOCK}$    | WAKE assertion time, internal Hibernation oscillator stopped during hibernation <sup>b</sup>                         | 10  | -   | -               | ms      |
| H7           | $T_{HIB\_REG\_ACCESS}$ | Time required for a write to a non-volatile register in the HIB module to complete                                   | 92  | -   | -               | $\mu s$ |
| H8           | $T_{HIB\_TO\_HIB}$     | HIB high time between assertions                                                                                     | 100 | -   | -               | ms      |
| H9           | $T_{ENTER\_HIB}$       | Time to enter hibernation mode from hibernation request                                                              | -   | 0   | 35 <sup>c</sup> | ms      |

a. Code begins executing after the time period specified by  $T_{IRPOR}$  following the deassertion of HIB.

b. This mode is used when the PINWEN bit is set and the RTCEN bit is clear in the **HIBCTL** register.

c. Nominal specification occurs 99.998% of the time.

**Figure 26-11. Hibernation Module Timing with Internal Oscillator Running in Hibernation****Figure 26-12. Hibernation Module Timing with Internal Oscillator Stopped in Hibernation**

## 26.11 Flash Memory

**Table 26-19. Flash Memory Characteristics**

| Parameter          | Parameter Name                                                        | Min    | Nom | Max | Unit   |
|--------------------|-----------------------------------------------------------------------|--------|-----|-----|--------|
| PE <sub>CYC</sub>  | Number of guaranteed program/erase cycles before failure <sup>a</sup> | 15,000 | -   | -   | cycles |
| T <sub>RET</sub>   | Data retention, -40°C to +85°C                                        | 10     | -   | -   | years  |
| T <sub>PROG</sub>  | Word program time                                                     | -      | -   | 1   | ms     |
| T <sub>BPROG</sub> | Buffer program time                                                   | -      | -   | 1   | ms     |
| T <sub>ERASE</sub> | Page erase time                                                       | -      | -   | 12  | ms     |
| T <sub>ME</sub>    | Mass erase time                                                       | -      | -   | 16  | ms     |

a. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1.

## 26.12 GPIO Module

**Note:** All GPIOs are 5-V tolerant, except PB0 and PB1. See “Signal Description” on page 423 for more information on GPIO configuration.

**Table 26-20. GPIO Module Characteristics**

| Parameter           | Parameter Name                                                 | Min | Nom | Max | Unit |
|---------------------|----------------------------------------------------------------|-----|-----|-----|------|
| R <sub>GPIOPU</sub> | GPIO internal pull-up resistor                                 | 100 | -   | 300 | kΩ   |
| R <sub>GPIOPD</sub> | GPIO internal pull-down resistor                               | 200 | -   | 500 | kΩ   |
| I <sub>LKG</sub>    | GPIO input leakage current <sup>a</sup>                        | -   | -   | 2   | μA   |
| T <sub>GPIOR</sub>  | GPIO Rise Time, 2-mA drive <sup>b</sup>                        | -   | 14  | 20  | ns   |
|                     | GPIO Rise Time, 4-mA drive <sup>b</sup>                        |     | 7   | 10  | ns   |
|                     | GPIO Rise Time, 8-mA drive <sup>b</sup>                        |     | 4   | 5   | ns   |
|                     | GPIO Rise Time, 8-mA drive with slew rate control <sup>b</sup> |     | 6   | 8   | ns   |
| T <sub>GPIOF</sub>  | GPIO Fall Time, 2-mA drive <sup>c</sup>                        | -   | 14  | 21  | ns   |
|                     | GPIO Fall Time, 4-mA drive <sup>c</sup>                        |     | 7   | 11  | ns   |
|                     | GPIO Fall Time, 8-mA drive <sup>c</sup>                        |     | 4   | 6   | ns   |
|                     | GPIO Fall Time, 8-mA drive with slew rate control <sup>c</sup> |     | 6   | 8   | ns   |

a. The leakage current is measured with GND or VDD applied to the corresponding pin(s). The leakage of digital port pins is measured individually. The port pin is configured as an input and the pullup/pulldown resistor is disabled.

b. Time measured from 20% to 80% of V<sub>DD</sub>.

c. Time measured from 80% to 20% of V<sub>DD</sub>.

## 26.13 External Peripheral Interface (EPI)

When the EPI module is in SDRAM mode, the drive strength must be configured to 8 mA. Table 26-21 on page 1202 shows the rise and fall times in SDRAM mode with 16 pF load conditions. When the EPI module is in Host-Bus or General-Purpose mode, the values in “GPIO Module” on page 1202 should be used.

**Table 26-21. EPI SDRAM Characteristics**

| Parameter           | Parameter Name                                      | Condition                          | Min | Nom | Max | Unit |
|---------------------|-----------------------------------------------------|------------------------------------|-----|-----|-----|------|
| T <sub>SDRAMR</sub> | EPI Rise Time (from 20% to 80% of V <sub>DD</sub> ) | 8-mA drive, C <sub>L</sub> = 16 pF | -   | 2   | 3   | ns   |

Table 26-21. EPI SDRAM Characteristics (continued)

| Parameter    | Parameter Name                               | Condition                 | Min | Nom | Max | Unit |
|--------------|----------------------------------------------|---------------------------|-----|-----|-----|------|
| $T_{SDRAMF}$ | EPI Fall Time (from 80% to 20% of $V_{DD}$ ) | 8-mA drive, $C_L = 16$ pF | -   | 2   | 3   | ns   |

Table 26-22. EPI SDRAM Interface Characteristics<sup>a</sup>

| Parameter No | Parameter | Parameter Name         | Min | Nom | Max | Unit |
|--------------|-----------|------------------------|-----|-----|-----|------|
| E1           | $T_{CK}$  | SDRAM Clock period     | 20  | -   | -   | ns   |
| E2           | $T_{CH}$  | SDRAM Clock high time  | 10  | -   | -   | ns   |
| E3           | $T_{CL}$  | SDRAM Clock low time   | 10  | -   | -   | ns   |
| E4           | $T_{COV}$ | CLK to output valid    | -5  | -   | 5   | ns   |
| E5           | $T_{COI}$ | CLK to output invalid  | -5  | -   | 5   | ns   |
| E6           | $T_{COT}$ | CLK to output tristate | -5  | -   | 5   | ns   |
| E7           | $T_S$     | Input set up to CLK    | 10  | -   | -   | ns   |
| E8           | $T_H$     | CLK to input hold      | 0   | -   | -   | ns   |
| E9           | $T_{PU}$  | Power-up time          | 100 | -   | -   | μs   |
| E10          | $T_{RP}$  | Precharge all banks    | 20  | -   | -   | ns   |
| E11          | $T_{RFC}$ | Auto refresh           | 66  | -   | -   | ns   |
| E12          | $T_{MRD}$ | Program mode register  | 40  | -   | -   | ns   |

a. The EPI SDRAM interface must use 8-mA drive.

Figure 26-13. SDRAM Initialization and Load Mode Register Timing

## Notes:

1. If CS is high at clock high time, all applied commands are NOP.
2. The **Mode** register may be loaded prior to the auto refresh cycles if desired.
3. JEDEC and PC100 specify three clocks.
4. Outputs are guaranteed High-Z after command is issued.

**Table 26-24. EPI General-Purpose Interface Characteristics**

| Parameter No | Parameter   | Parameter Name                                                  | Min | Nom | Max | Unit |
|--------------|-------------|-----------------------------------------------------------------|-----|-----|-----|------|
| E25          | $T_{CK}$    | General-Purpose Clock period                                    | 20  | -   | -   | ns   |
| E26          | $T_{CH}$    | General-Purpose Clock high time                                 | 10  | -   | -   | ns   |
| E27          | $T_{CL}$    | General-Purpose Clock low time                                  | 10  | -   | -   | ns   |
| E28          | $T_{ISU}$   | Input signal set up time to rising clock edge                   | 10  | -   | -   | ns   |
| E29          | $T_{IH}$    | Input signal hold time from rising clock edge                   | 0   | -   | -   | ns   |
| E30          | $T_{DV}$    | Falling clock edge to output valid                              | -5  | -   | 5   | ns   |
| E31          | $T_{DI}$    | Falling clock edge to output invalid                            | -5  | -   | 5   | ns   |
| E32          | $T_{RDYSU}$ | iRDY assertion or deassertion set up time to falling clock edge | 10  | -   | -   | ns   |

**Figure 26-20. General-Purpose Mode Read and Write Timing**

The above figure illustrates accesses where the FRM50 bit is clear, the FRMCNT field is 0x0, the RD2CYC bit is clear, and the WR2CYC bit is clear.

**Figure 26-21. General-Purpose Mode iRDY Timing**

## 26.14 Analog-to-Digital Converter (ADC)

**Table 26-25. ADC Characteristics<sup>a</sup>**

| Parameter            | Parameter Name                                                                  | Min     | Nom | Max                 | Unit               |
|----------------------|---------------------------------------------------------------------------------|---------|-----|---------------------|--------------------|
| $V_{\text{ADCIN}}$   | Maximum single-ended, full-scale analog input voltage, using internal reference | -       | -   | 3.0                 | V                  |
|                      | Maximum single-ended, full-scale analog input voltage, using external reference | -       | -   | $V_{\text{REFA}}$   | V                  |
|                      | Minimum single-ended, full-scale analog input voltage                           | 0.0     | -   | -                   | V                  |
|                      | Maximum differential, full-scale analog input voltage, using internal reference | -       | -   | 1.5                 | V                  |
|                      | Maximum differential, full-scale analog input voltage, using external reference | -       | -   | $V_{\text{REFA}}/2$ | V                  |
|                      | Minimum differential, full-scale analog input voltage                           | 0.0     | -   | -                   | V                  |
| N                    | Resolution                                                                      | 10      |     |                     | bits               |
| $F_{\text{ADC}}$     | ADC internal clock frequency <sup>b</sup>                                       | 15.9952 | 16  | 16.0048             | MHz                |
| $T_{\text{ADCCONV}}$ | Conversion time <sup>c</sup>                                                    | 1       |     |                     | $\mu\text{s}$      |
| $F_{\text{ADCCONV}}$ | Conversion rate <sup>c</sup>                                                    | 1000    |     |                     | k samples/s        |
| $T_{\text{ADCSAMP}}$ | Sample time                                                                     | 187.5   | -   | -                   | ns                 |
| $T_{\text{LT}}$      | Latency from trigger to start of conversion                                     | -       | 2   | -                   | system clocks      |
| $I_{\text{L}}$       | ADC input leakage                                                               | -       | -   | 2.0                 | $\mu\text{A}$      |
| $R_{\text{ADC}}$     | ADC equivalent resistance                                                       | -       | -   | 10                  | k $\Omega$         |
| $C_{\text{ADC}}$     | ADC equivalent capacitance                                                      | 0.9     | 1.0 | 1.1                 | pF                 |
| $E_{\text{L}}$       | Integral nonlinearity (INL) error                                               | -       | -   | $\pm 3$             | LSB                |
| $E_{\text{D}}$       | Differential nonlinearity (DNL) error                                           | -       | -   | $\pm 3$             | LSB                |
| $E_{\text{O}}$       | Offset error                                                                    | -       | -   | $\pm 20$            | LSB                |
| $E_{\text{G}}$       | Full-scale gain error                                                           | -       | -   | $\pm 30$            | LSB                |
| $E_{\text{TS}}$      | Temperature sensor accuracy <sup>d</sup>                                        | -       | -   | $\pm 5$             | $^{\circ}\text{C}$ |

a. The ADC reference voltage is 3.0 V. This reference voltage is internally generated from the 3.3 V<sub>DDA</sub> supply by a band gap circuit.

b. The ADC must be clocked from the PLL or directly from an external clock source to operate properly.

c. The conversion time and rate scale from the specified number if the ADC internal clock frequency is any value other than 16 MHz.

d. Note that this parameter does not include ADC error.

Figure 26-22. ADC Input Equivalency Diagram

Table 26-26. ADC Module External Reference Characteristics<sup>a</sup>

| Parameter         | Parameter Name                                  | Min  | Nom | Max  | Unit          |
|-------------------|-------------------------------------------------|------|-----|------|---------------|
| $V_{\text{REFA}}$ | External voltage reference for ADC <sup>b</sup> | 2.97 | -   | 3.03 | V             |
| $I_L$             | External voltage reference leakage current      | -    | -   | 2.0  | $\mu\text{A}$ |

a. Care must be taken to supply a reference voltage of acceptable quality.

b. Ground is always used as the reference level for the minimum conversion value.

Table 26-27. ADC Module Internal Reference Characteristics

| Parameter         | Parameter Name                     | Min | Nom | Max | Unit |
|-------------------|------------------------------------|-----|-----|-----|------|
| $V_{\text{REFI}}$ | Internal voltage reference for ADC | -   | 3.0 | -   | V    |

## 26.15 Synchronous Serial Interface (SSI)

Table 26-28. SSI Characteristics

| Parameter No. | Parameter              | Parameter Name                     | Min | Nom | Max | Unit          |
|---------------|------------------------|------------------------------------|-----|-----|-----|---------------|
| S1            | $T_{\text{CLK\_PER}}$  | SSIClk cycle time <sup>a</sup>     | 100 | -   | -   | ns            |
| S2            | $T_{\text{CLK\_HIGH}}$ | SSIClk high time                   | -   | 0.5 | -   | t clk_per     |
| S3            | $T_{\text{CLK\_LOW}}$  | SSIClk low time                    | -   | 0.5 | -   | t clk_per     |
| S4            | $T_{\text{CLKRF}}$     | SSIClk rise/fall time <sup>b</sup> | -   | 4   | 6   | ns            |
| S5            | $T_{\text{DMD}}$       | Data from master valid delay time  | 0   | -   | 1   | system clocks |
| S6            | $T_{\text{DMS}}$       | Data from master setup time        | 1   | -   | -   | system clocks |
| S7            | $T_{\text{DMH}}$       | Data from master hold time         | 2   | -   | -   | system clocks |
| S8            | $T_{\text{DSS}}$       | Data from slave setup time         | 1   | -   | -   | system clocks |
| S9            | $T_{\text{DSH}}$       | Data from slave hold time          | 2   | -   | -   | system clocks |

a. In master mode, the system clock must be at least twice as fast as the SSIClk; in slave mode, the system clock must be at least 12 times faster than the SSIClk.

b. Note that the delays shown are using 8-mA drive strength.

## 26.16 Inter-Integrated Circuit (I<sup>2</sup>C) Interface

**Table 26-29. I<sup>2</sup>C Characteristics**

| Parameter No.   | Parameter         | Parameter Name                                                               | Min | Nom | Max          | Unit          |
|-----------------|-------------------|------------------------------------------------------------------------------|-----|-----|--------------|---------------|
| 11 <sup>a</sup> | T <sub>SCH</sub>  | Start condition hold time                                                    | 36  | -   | -            | system clocks |
| 12 <sup>a</sup> | T <sub>LP</sub>   | Clock Low period                                                             | 36  | -   | -            | system clocks |
| 13 <sup>b</sup> | T <sub>SRT</sub>  | I2CSCL/I2CSDA rise time (V <sub>IL</sub> = 0.5 V to V <sub>IH</sub> = 2.4 V) | -   | -   | (see note b) | ns            |
| 14 <sup>a</sup> | T <sub>DH</sub>   | Data hold time                                                               | 2   | -   | -            | system clocks |
| 15 <sup>c</sup> | T <sub>SFT</sub>  | I2CSCL/I2CSDA fall time (V <sub>IH</sub> = 2.4 V to V <sub>IL</sub> = 0.5 V) | -   | 9   | 10           | ns            |
| 16 <sup>a</sup> | T <sub>HT</sub>   | Clock High time                                                              | 24  | -   | -            | system clocks |
| 17 <sup>a</sup> | T <sub>DS</sub>   | Data setup time                                                              | 18  | -   | -            | system clocks |
| 18 <sup>a</sup> | T <sub>SCSR</sub> | Start condition setup time (for repeated start condition only)               | 36  | -   | -            | system clocks |
| 19 <sup>a</sup> | T <sub>SCS</sub>  | Stop condition setup time                                                    | 24  | -   | -            | system clocks |

a. Values depend on the value programmed into the TPR bit in the **I<sup>2</sup>C Master Timer Period (I2CMTPR)** register; a TPR programmed for the maximum I2CSCL frequency (TPR=0x2) results in a minimum output timing as shown in the table above. The I<sup>2</sup>C interface is designed to scale the actual data transition time to move it to the middle of the I2CSCL Low period. The actual position is affected by the value programmed into the TPR; however, the numbers given in the above values are minimum values.

b. Because I2CSCL and I2CSDA are open-drain-type outputs, which the controller can only actively drive Low, the time I2CSCL or I2CSDA takes to reach a high level depends on external signal capacitance and pull-up resistor values.

c. Specified at a nominal 50 pF load.

## 26.18 Ethernet Controller

Table 26-34. 100BASE-TX Transmitter Characteristics<sup>a</sup>

| Parameter Name            | Min | Nom | Max  | Unit |
|---------------------------|-----|-----|------|------|
| Peak output amplitude     | 950 | -   | 1050 | mVpk |
| Output amplitude symmetry | 98  | -   | 102  | %    |

**Table 26-34. 100BASE-TX Transmitter Characteristics (continued)**

| Parameter Name           | Min | Nom | Max  | Unit |
|--------------------------|-----|-----|------|------|
| Output overshoot         | -   | -   | 5    | %    |
| Rise/Fall time           | 3   | -   | 5    | ns   |
| Rise/Fall time imbalance | -   | -   | 500  | ps   |
| Duty cycle distortion    | -   | -   | ±250 | ps   |
| Jitter                   | -   | -   | 1.4  | ns   |

a. Measured at the line side of the transformer.

**Table 26-35. 100BASE-TX Transmitter Characteristics (informative)<sup>a</sup>**

| Parameter Name          | Min | Nom | Max | Unit |
|-------------------------|-----|-----|-----|------|
| Return loss             | 16  | -   | -   | dB   |
| Open-circuit inductance | 350 | -   | -   | μH   |

a. The specifications in this table are included for information only. They are mainly a function of the external transformer and termination resistors used for measurements.

**Table 26-36. 100BASE-TX Receiver Characteristics**

| Parameter Name                       | Min | Nom | Max  | Unit  |
|--------------------------------------|-----|-----|------|-------|
| Signal detect assertion threshold    | 600 | 700 | -    | mVppd |
| Signal detect de-assertion threshold | 350 | 425 | -    | mVppd |
| Differential input resistance        | -   | 3.6 | -    | kΩ    |
| Jitter tolerance (pk-pk)             | 4   | -   | -    | ns    |
| Baseline wander tracking             | -80 | -   | +80  | %     |
| Signal detect assertion time         | -   | -   | 1000 | μs    |
| Signal detect de-assertion time      | -   | -   | 4    | μs    |

**Table 26-37. 10BASE-T Transmitter Characteristics<sup>a</sup>**

| Parameter Name                        | Min | Nom | Max | Unit |
|---------------------------------------|-----|-----|-----|------|
| Peak differential output signal       | 2.2 | -   | 2.7 | V    |
| Harmonic content                      | 27  | -   | -   | dB   |
| Link pulse width                      | -   | 100 | -   | ns   |
| Start-of-idle pulse width, Last bit 0 | -   | 300 | -   | ns   |
| Start-of-idle pulse width, Last bit 1 | -   | 350 | -   | ns   |

a. The Manchester-encoded data pulses, the link pulse and the start-of-idle pulse are tested against the templates and using the procedures found in Clause 14 of *IEEE 802.3*.

**Table 26-38. 10BASE-T Transmitter Characteristics (informative)<sup>a</sup>**

| Parameter Name                  | Min            | Nom | Max | Unit |
|---------------------------------|----------------|-----|-----|------|
| Output return loss              | 15             | -   | -   | dB   |
| Output impedance balance        | 29-17log(f/10) | -   | -   | dB   |
| Peak common-mode output voltage | -              | -   | 50  | mV   |
| Common-mode rejection           | -              | -   | 100 | mV   |
| Common-mode rejection jitter    | -              | -   | 1   | ns   |

a. The specifications in this table are included for information only. They are mainly a function of the external transformer and termination resistors used for measurements.

**Table 26-39. 10BASE-T Receiver Characteristics**

| Parameter Name                | Min | Nom | Max | Unit  |
|-------------------------------|-----|-----|-----|-------|
| Jitter tolerance (pk-pk)      | 30  | 26  | -   | ns    |
| Input squelched threshold     | 340 | 440 | 540 | mVppd |
| Differential input resistance | -   | 3.6 | -   | kΩ    |
| Common-mode rejection         | 25  | -   | -   | V     |

**Table 26-40. Isolation Transformers<sup>a</sup>**

| Name                      | Value         | Condition       |
|---------------------------|---------------|-----------------|
| Turns ratio               | 1 CT : 1 CT   | +/- 5%          |
| Open-circuit inductance   | 350 uH (min)  | @ 10 mV, 10 kHz |
| Leakage inductance        | 0.40 uH (max) | @ 1 MHz (min)   |
| Inter-winding capacitance | 25 pF (max)   |                 |
| DC resistance             | 0.9 Ohm (max) |                 |
| Insertion loss            | 0.4 dB (typ)  | 0-65 MHz        |
| HIPOT                     | 1500          | Vrms            |

a. Two simple 1:1 isolation transformers are required at the line interface. Transformers with integrated common-mode chokes are recommended for exceeding FCC requirements. This table gives the recommended line transformer characteristics.

**Note:** The 100Base-TX amplitude specifications assume a transformer loss of 0.4 dB.

## 26.19 Universal Serial Bus (USB) Controller

The Stellaris® USB controller electrical specifications are compliant with the *Universal Serial Bus Specification Rev. 2.0* (full-speed and low-speed support). Some components of the USB system are integrated within the LM3S5R31 microcontroller and specific to the Stellaris microcontroller design. An external component resistor is needed as specified in Table 26-41.

**Table 26-41. USB Controller Characteristics**

| Parameter | Parameter Name                                       | Value      | Unit |
|-----------|------------------------------------------------------|------------|------|
| RUBIAS    | Value of the pull-down resistor on the USB0RBIAS pin | 9.1K ± 1 % | Ω    |

## 26.20 Analog Comparator

**Table 26-42. Analog Comparator Characteristics**

| Parameter        | Parameter Name                         | Min | Nom | Max                  | Unit |
|------------------|----------------------------------------|-----|-----|----------------------|------|
| V <sub>OS</sub>  | Input offset voltage                   | -   | ±10 | ±25                  | mV   |
| V <sub>CM</sub>  | Input common mode voltage range        | 0   | -   | V <sub>DD</sub> -1.5 | V    |
| C <sub>MRR</sub> | Common mode rejection ratio            | 50  | -   | -                    | dB   |
| T <sub>RT</sub>  | Response time                          | -   | -   | 1                    | μs   |
| T <sub>MC</sub>  | Comparator mode change to Output Valid | -   | -   | 10                   | μs   |

**Table 26-43. Analog Comparator Voltage Reference Characteristics**

|-----------------|-----------------------|-----|---------------------|-----|------|
| R <sub>HR</sub> | Resolution high range | -   | V <sub>DD</sub> /31 | -   | LSB  |

Table 26-43. Analog Comparator Voltage Reference Characteristics (continued)

| Parameter       | Parameter Name               | Min | Nom                 | Max  | Unit |
|-----------------|------------------------------|-----|---------------------|------|------|
| R <sub>LR</sub> | Resolution low range         | -   | V <sub>DD</sub> /23 | -    | LSB  |
| A <sub>HR</sub> | Absolute accuracy high range | -   | -                   | ±1/2 | LSB  |
| A <sub>LR</sub> | Absolute accuracy low range  | -   | -                   | ±1/4 | LSB  |

## 26.21 USB Module

The Stellaris USB controller electrical specifications are compliant with the *Universal Serial Bus Specification Rev. 2.0* (full-speed and low-speed support). Some components of the USB system are integrated within the LM3S5R31 microcontroller and specific to the Stellaris microcontroller design. An external component resistor is needed as specified in Table 26-44.

Table 26-44. USB Controller DC Characteristics

| Parameter          | Parameter Name                                       | Value      | Unit |
|--------------------|------------------------------------------------------|------------|------|
| R <sub>UBIAS</sub> | Value of the pull-down resistor on the USB0RBIAS pin | 9.1K ± 1 % | Ω    |

## 26.22 Current Consumption

This section provides information on typical and maximum power consumption under various conditions. Unless otherwise indicated, current consumption numbers include use of the on-chip LDO regulator and therefore include I<sub>DDC</sub>.

### 26.22.1 Nominal Power Consumption

The following table provides nominal figures for current consumption.

Table 26-45. Nominal Power Consumption

| Parameter                 | Parameter Name                                                              | Conditions                                                                                                                                             | Nom | Unit |
|---------------------------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-----|------|
| I <sub>DD_RUN</sub>       | Run mode 1 (Flash loop)                                                     | V <sub>DD</sub> = 3.3 V<br>Code= while(1){} executed out of Flash<br>Peripherals = All ON<br>System Clock = 80 MHz (with PLL)<br>Temp = 25°C           | 90  | mA   |
| I <sub>DD_DEEPSLEEP</sub> | Deep-sleep mode                                                             | Peripherals = All OFF<br>System Clock = IOS30KHZ/64<br>Temp = 25°C                                                                                     | 550 | μA   |
| I <sub>HIB_NORTC</sub>    | Hibernate mode (external wake, RTC disabled, I/O not powered <sup>a</sup> ) | V <sub>BAT</sub> = 3.0 V<br>V <sub>DD</sub> = 0 V<br>V <sub>DDA</sub> = 0 V<br>Peripherals = All OFF<br>System Clock = OFF<br>Hibernate Module = 0 kHz | 30  | μA   |

**Table 26-45. Nominal Power Consumption (continued)**

| Parameter      | Parameter Name                                              | Conditions                                                                                                                                              | Nom | Unit          |
|----------------|-------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----|---------------|
| $I_{HIB\_RTC}$ | Hibernate mode (RTC enabled, I/O not powered <sup>a</sup> ) | $V_{BAT} = 3.0\text{ V}$<br>$V_{DD} = 0\text{ V}$<br>$V_{DDA} = 0\text{ V}$<br>Peripherals = All OFF<br>System Clock = OFF<br>Hibernate Module = 32 kHz | 44  | $\mu\text{A}$ |

a. The VDD3ON mode must be disabled for the I/O ring to be unpowered.

## 26.22.2 Maximum Current Consumption

The current measurements specified in the table that follows are maximum values under the following conditions:

- $V_{DD} = 3.6\text{ V}$
- $V_{DDC} = 1.3\text{ V}$
- $V_{BAT} = 3.25\text{ V}$
- $V_{DDA} = 3.6\text{ V}$
- Temperature = 25°C
- Clock source (MOSC) = 3.579545-MHz crystal oscillator

**Table 26-46. Detailed Current Specifications**

| Parameter           | Parameter Name          | Conditions                                                                                                                                          | Max | Unit |
|---------------------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-----|------|

## B Ordering and Contact Information

### B.1 Ordering Information

**Table B-1. Part Ordering Information**

| Orderable Part Number | Description                                                                          |
|-----------------------|--------------------------------------------------------------------------------------|
| LM3S5R31-IQC80-C5     | Stellaris® LM3S5R31 Microcontroller Industrial Temperature 100-pin LQFP              |
| LM3S5R31-IBZ80-C5     | Stellaris LM3S5R31 Microcontroller Industrial Temperature 108-ball BGA               |
| LM3S5R31-IQC80-C5T    | Stellaris LM3S5R31 Microcontroller Industrial Temperature 100-pin LQFP Tape-and-reel |
| LM3S5R31-IBZ80-C5T    | Stellaris LM3S5R31 Microcontroller Industrial Temperature 108-ball BGA Tape-and-reel |

### B.2 Part Markings

The Stellaris microcontrollers are marked with an identifying number. This code contains the following information:

- The first line indicates the part number. In the example figure below, this is the LM3S9B90.
- In the second line, the first seven characters indicate the temperature, package, speed, and revision. In the example below, this is an Industrial temperature (I), 100-pin LQFP package (QC), 80-MHz (80), revision C0 (C0) device.
- The remaining characters contain internal tracking numbers.

## B.3 Kits

The Stellaris Family provides the hardware and software tools that engineers need to begin development quickly.

- Reference Design Kits accelerate product development by providing ready-to-run hardware and comprehensive documentation including hardware design files
- Evaluation Kits provide a low-cost and effective means of evaluating Stellaris microcontrollers before purchase
- Development Kits provide you with all the tools you need to develop and prototype embedded applications right out of the box

See the website at [www.ti.com/stellaris](http://www.ti.com/stellaris) for the latest tools available, or ask your distributor.

## B.4 Support Information

For support on Stellaris products, contact the TI Worldwide Product Information Center nearest you: <http://www-k.ext.ti.com/sc/technical-support/product-information-centers.htm>.

## C Package Information

### C.1 100-Pin LQFP Package

#### C.1.1 Package Dimensions

Figure C-1. 100-Pin LQFP Package Dimensions

**Note:** The following notes apply to the package drawing.

1. All dimensions shown in mm.
2. Dimensions shown are nominal with tolerances indicated.
3. Foot length 'L' is measured at gage plane 0.25 mm above seating plane.

| Body +2.00 mm Footprint, 1.4 mm package thickness |             |                     |
|---------------------------------------------------|-------------|---------------------|
| Symbols                                           | Leads       | 100L                |
| A                                                 | Max.        | 1.60                |
| A <sub>1</sub>                                    | -           | 0.05 Min./0.15 Max. |
| A <sub>2</sub>                                    | ±0.05       | 1.40                |
| D                                                 | ±0.20       | 16.00               |
| D <sub>1</sub>                                    | ±0.05       | 14.00               |
| E                                                 | ±0.20       | 16.00               |
| E <sub>1</sub>                                    | ±0.05       | 14.00               |
| L                                                 | +0.15/-0.10 | 0.60                |
| e                                                 | Basic       | 0.50                |
| b                                                 | +0.05       | 0.22                |
| θ                                                 | -           | 0°-7°               |
| ddd                                               | Max.        | 0.08                |
| ccc                                               | Max.        | 0.08                |
| JEDEC Reference Drawing                           |             | MS-026              |
| Variation Designator                              |             | BED                 |

C.1.2 Tray Dimensions

Figure C-2. 100-Pin LQFP Tray Dimensions

C.1.3 Tape and Reel Dimensions

**Note:** In the figure that follows, pin 1 is located in the top right corner of the device.

Figure C-3. 100-Pin LQFP Tape and Reel Dimensions

## C.2 108-Ball BGA Package

### C.2.1 Package Dimensions

Figure C-4. 108-Ball BGA Package Dimensions

**Note:** The following notes apply to the package drawing.

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. 'e' REPRESENTS THE BASIC SOLDER BALL GRID PITCH.
3. 'M' REPRESENTS THE BASIC SOLDER BALL MATRIX SIZE.  
AND SYMBOL 'N' IS THE NUMBER OF BALLS AFTER DEPOPULATING.
4. 'b' IS MEASURABLE AT THE MAXIMUM SOLDER BALL DIAMETER AFTER REFLOW  
PARALLEL TO PRIMARY DATUM [C].
5. DIMENSION 'ccc' IS MEASURED PARALLEL TO PRIMARY DATUM [C].
6. PRIMARY DATUM [C] AND SEATING PLANE ARE DEFINED BY THE SPHERICAL  
CROWNS OF THE SOLDER BALLS.
7. PACKAGE SURFACE SHALL BE MATTE FINISH CHARMILLES 24 TO 27.
8. SUBSTRATE MATERIAL BASE IS BT RESIN.
9. THE OVERALL PACKAGE THICKNESS "A" ALREADY CONSIDERS COLLAPSE BALLS
10. DIMENSIONING AND TOLERANCING PER ASME Y14.5M 1994.
11. EXCEPT DIMENSION b.

| Symbols            | MIN      | NOM   | MAX   |

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
