## **LDO Linear Regulators - Micropower, ENABLE, DELAY, RESET, Monitor FLAG**

### **150 mA**

The NCV8501 is a family of precision micropower voltage regulators. Their output current capability is 150 mA. The family has output voltage options for adjustable, 2.5 V, 3.3 V, 5.0 V, 8.0 V, and 10 V.

The output voltage is accurate within  $\pm 2.0\%$  with a maximum dropout voltage of 0.6 V at 150 mA. Low quiescent current is a feature drawing only 90  $\mu\text{A}$  with a 100  $\mu\text{A}$  load. This part is ideal for any and all battery operated microprocessor equipment.

Microprocessor control logic includes an active  $\overline{\text{RESET}}$  (with DELAY), and a FLAG monitor which can be used to provide an early warning signal to the microprocessor of a potential impending  $\overline{\text{RESET}}$  signal. The use of the FLAG monitor allows the microprocessor to finish any signal processing before the  $\overline{\text{RESET}}$  shuts the microprocessor down.

The active  $\overline{\text{RESET}}$  circuit operates correctly at an output voltage as low as 1.0 V. The  $\overline{\text{RESET}}$  function is activated during the power up sequence or during normal operation if the output voltage drops outside the regulation limits.

The regulator is protected against reverse battery, short circuit, and thermal overload conditions. The device can withstand load dump transients making it suitable for use in automotive environments. The device has also been optimized for EMC conditions.

### **Features**

- Output Voltage Options: Adjustable, 2.5 V, 3.3 V, 5.0 V, 8.0 V, 10 V
- $\pm 2.0\%$  Output
- Low 90  $\mu\text{A}$  Quiescent Current
- Fixed or Adjustable Output Voltage
- Active  $\overline{\text{RESET}}$
- ENABLE
- 150 mA Output Current Capability
- Fault Protection
  - ♦ +60 V Peak Transient Voltage
  - ♦ -15 V Reverse Voltage
  - ♦ Short Circuit
  - ♦ Thermal Overload
- Early Warning through  $\overline{\text{FLAG}}$ /MON Leads
- NCV Prefix for Automotive and Other Applications Requiring Site and Change Control
- These are Pb-Free Devices

### **MARKING DIAGRAMS**

x = Voltage Ratings as Indicated Below:  
A = Adjustable  
2 = 2.5 V  
3 = 3.3 V  
5 = 5.0 V  
8 = 8.0 V  
0 = 10 V  
A = Assembly Location  
WL, L = Wafer Lot  
YY, Y = Year  
WW, W = Work Week  
G or ■ = Pb-Free Package

### **ORDERING INFORMATION**

See detailed ordering and shipping information in the package dimensions section on page 14 of this data sheet.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

\*During the voltage range which exceeds the maximum tested voltage of  $V_{IN}$ , operation is assured, but not specified. Wider limits may apply. Thermal dissipation must be observed closely.

**\*\*Reference Figure 15 for switched-battery ENABLE application.**

1. Measured to pin 16.
2. 150 second maximum above 217°C.
3. -5°C / +0°C allowable conditions.

## CIRCUIT DESCRIPTION

### REGULATOR CONTROL FUNCTIONS

The NCV8501 contains the microprocessor compatible control function  $\overline{\text{RESET}}$  (Figure 14).

Figure 14. Reset and Delay Circuit Wave Forms

### RESET Function

A  $\overline{\text{RESET}}$  signal (low voltage) is generated as the IC powers up until  $V_{\text{OUT}}$  is within 6.0% of the regulated output voltage, or when  $V_{\text{OUT}}$  drops out of regulation, and is lower than 8.0% below the regulated output voltage. Hysteresis is included in the function to minimize oscillations.

The  $\overline{\text{RESET}}$  output is an open collector NPN transistor, controlled by a low voltage detection circuit. The circuit is functionally independent of the rest of the IC thereby guaranteeing that the  $\overline{\text{RESET}}$  signal is valid for  $V_{\text{OUT}}$  as low as 1.0 V.

### ENABLE Function

The part stays in a low  $I_{\text{Q}}$  sleep mode when the ENABLE pin is held low. The part has an internal pull down if the pin is left floating. This is intended for failure modes only. An external connection (active pulldown, resistor, or switch) for normal operation is recommended.

The integrity of the ENABLE pin allows it to be tied directly to the battery line through an external resistor. It will withstand load dump potentials in this configuration.

Figure 15. ENABLE Function

### DELAY Function

The reset delay circuit provides a programmable (by external capacitor) delay on the  $\overline{\text{RESET}}$  output lead.

The DELAY lead provides source current (typically 2.5  $\mu\text{A}$ ) to the external DELAY capacitor during the following proceedings:

1. During Power Up (once the regulation threshold has been verified).
2. After a reset event has occurred and the device is back in regulation. The DELAY capacitor is discharged when the regulation ( $\overline{\text{RESET}}$  threshold) has been violated. This is a latched incident. The capacitor will fully discharge and wait for the device to regulate before going through the delay time event again.

### FLAG/Monitor Function

An on-chip comparator is provided to perform an early warning to the microprocessor of a possible reset signal. The reset signal typically turns the microprocessor off instantaneously. This can cause unpredictable results with the microprocessor. The signal received from the  $\overline{\text{FLAG}}$  pin will allow the microprocessor time to complete its present task before shutting down. This function is performed by a comparator referenced to the bandgap reference. The actual trip point can be programmed externally using a resistor divider to the input monitor (MON) (Figure 16). The typical threshold is 1.20 V on the MON pin.

Figure 16. FLAG/Monitor Function

### Voltage Adjust

Figure 17 shows the device setup for a user configurable output voltage. The feedback to the  $V_{\text{ADJ}}$  pin is taken from a voltage divider referenced to the output voltage. The loop is balanced around the Unity Gain threshold (1.28 V typical).

Figure 17. Adjustable Output Voltage

## APPLICATION NOTES

**Figure 18. Additional Output Current**

### Adding Capability

Figure 18 shows how the adjustable version of parts can be used with an external pass transistor for additional current capability. The setup as shown will provide greater than 1 Amp of output current.

### FLAG MONITOR

Figure 19 shows the FLAG Monitor waveforms as a result of the circuit depicted in Figure 16. As the output voltage falls ( $V_{OUT}$ ), the Monitor threshold is crossed. This causes the voltage on the  $\overline{FLAG}$  output to go low sending a warning signal to the microprocessor that a  $\overline{RESET}$  signal may occur in a short period of time.  $T_{WARNING}$  is the time the microprocessor has to complete the function it is currently working on and get ready for the  $\overline{RESET}$  shutdown signal.

**Figure 19. FLAG Monitor Circuit Waveform**

\* $C_{IN}$  required if regulator is located far from the power supply filter

\*\* $C_{OUT}$  required for stability. Capacitor must operate at minimum temperature expected

**Figure 20. Test and Application Circuit Showing Output Compensation**

### SETTING THE DELAY TIME

The delay time is controlled by the Reset Delay Low Voltage, Delay Switching Threshold, and the Delay Charge Current. The delay follows the equation:

$$t_{DELAY} = \frac{[C_{DELAY}(V_{dt} - \text{Reset Delay Low Voltage})]}{\text{Delay Charge Current}}$$

Example:

Using  $C_{DELAY} = 33 \text{ nF}$ .

Assume reset Delay Low Voltage = 0.

Use the typical value for  $V_{dt} = 1.8 \text{ V}$ .

Use the typical value for Delay Charge Current =  $2.5 \mu\text{A}$ .

$$t_{DELAY} = \frac{[33 \text{ nF}(1.8 - 0)]}{2.5 \mu\text{A}} = 23.8 \text{ ms}$$

### STABILITY CONSIDERATIONS

The output or compensation capacitor helps determine three main characteristics of a linear regulator: start-up delay, load transient response and loop stability.

The capacitor value and type should be based on cost, availability, size and temperature constraints.

The value for the output capacitor  $C_{OUT}$  shown in Figure 20 should work for most applications, however it is not necessarily the optimized solution.

## UNDERSTANDING THE NCV8501 ENABLE PIN INPUT CURRENT

**Figure 21. NCV8501 Enable Function Equivalent Circuit**

Z1, R1, and Z2 provide ESD and overvoltage protection. Note that, for ENABLE pin voltages in excess of 10 V, an external series resistor is required to limit the current into Z1.

For ENABLE pin voltages less than +7 V, the 5 μA (maximum value) current source dominates the input current, as the opposing P1 base current is negligible by comparison.

For ENABLE pin voltages between +7 V and +11 V, the input current is given by:

$$5 \mu\text{A} + ((V_{\text{ENABLE}} - 7) / 20 \text{ k}\Omega)$$

For ENABLE pin voltages in excess of 10 V (Z1 breakover voltage can be as low as 10 V), the input current is dominated by the external series resistor. For the case where  $V_{\text{ENABLE}} = 12 \text{ V}$ ;  $R_{\text{EXT}} = 10 \text{ k}\Omega$ , the input current can be up to  $(2 \text{ V} / 10 \text{ k}\Omega) = 200 \mu\text{A}$ .

The ENABLE threshold is that voltage required to achieve ~3.85 V at the base of N1, or approximately  $(3.85 \text{ V} - 2 \text{ V}_{\text{be}})$ . At +20°C, this threshold is ~2.55 V. At -40°C, it can be as high as 3 V.

If the value of  $R_{\text{EXT}}$  is increased to ~200 kΩ, to reduce ENABLE input current, then the worst-case drop across  $R_{\text{EXT}}$  must be added to 3 V to determine the effective maximum ENABLE threshold. At  $V_{\text{ENABLE}} < 7 \text{ V}$ , we only need to consider the 5 μA current sink.

$$\begin{aligned} \text{Max effective threshold} &= 3 \text{ V} + (5 \mu\text{A} * 220 \text{ k}\Omega) \\ &= 3 \text{ V} + 1.1 \text{ V} \\ &= 4.1 \text{ V} \end{aligned}$$

## CALCULATING POWER DISSIPATION IN A SINGLE OUTPUT LINEAR REGULATOR

The maximum power dissipation for a single output regulator (Figure 22) is:

$$P_{\text{D(max)}} = [V_{\text{IN(max)}} - V_{\text{OUT(min)}}] I_{\text{OUT(max)}} + V_{\text{IN(max)}} I_{\text{Q}} \quad (\text{eq. 1})$$

where:

$V_{\text{IN(max)}}$  is the maximum input voltage,

$V_{\text{OUT(min)}}$  is the minimum output voltage,

$I_{\text{OUT(max)}}$  is the maximum output current for the application, and

$I_{\text{Q}}$  is the quiescent current the regulator consumes at  $I_{\text{OUT(max)}}$ .

Once the value of  $P_{\text{D(max)}}$  is known, the maximum permissible value of  $R_{\theta\text{JA}}$  can be calculated:

$$R_{\theta\text{JA}} = \frac{150^\circ\text{C} - T_{\text{A}}}{P_{\text{D}}} \quad (\text{eq. 2})$$

The value of  $R_{\theta\text{JA}}$  can then be compared with those in the package section of the data sheet. Those packages with  $R_{\theta\text{JA}}$ 's less than the calculated value in Equation 2 will keep the die temperature below 150°C.

In some cases, none of the packages will be sufficient to dissipate the heat generated by the IC, and an external heatsink will be required.

**Figure 22. Single Output Regulator with Key Performance Parameters Labeled**

**Figure 23. 16 Lead SOW (Exposed Pad),  $\theta_{\text{JA}}$  as a Function of the Pad Copper Area (2 oz. Cu Thickness), Board Material = 0.0625" G-10/R-4**

### HEATSINKS

A heatsink effectively increases the surface area of the package to improve the flow of heat away from the IC and into the surrounding air.

Each material in the heat flow path between the IC and the outside environment will have a thermal resistance. Like series electrical resistances, these resistances are summed to determine the value of  $R_{\theta JA}$ :

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CS} + R_{\theta SA} \quad (\text{eq. 3})$$

where:

$R_{\theta JC}$  = the junction-to-case thermal resistance,

$R_{\theta CS}$  = the case-to-heatsink thermal resistance, and

$R_{\theta SA}$  = the heatsink-to-ambient thermal resistance.

$R_{\theta JC}$  appears in the package section of the data sheet. Like  $R_{\theta JA}$ , it too is a function of package type.  $R_{\theta CS}$  and  $R_{\theta SA}$  are functions of the package type, heatsink and the interface between them. These values appear in heatsink data sheets of heatsink manufacturers.

SCALE 1:1

SOIC 16 LEAD WIDE BODY, EXPOSED PAD  
CASE 751AG  
ISSUE B

DATE 31 MAY 2016

NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSION A AND B DO NOT INCLUDE MOLD PROTRUSION.
4. MAXIMUM MOLD PROTRUSION 0.15 (0.006) PER SIDE.
5. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.13 (0.005) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. 751R-01 OBSOLETE, NEW STANDARD 751R-02.

| DIM | MIN      | MAX   | MIN       | MAX   |

GENERIC  
MARKING DIAGRAM\*

XXXXXX = Specific Device Code  
A = Assembly Location  
WL = Wafer Lot  
YY = Year  
WW = Work Week  
G = Pb-Free Package

\*This information is generic. Please refer to device data sheet for actual part marking. Pb-Free indicator, "G" or microdot "▪", may or may not be present.

SOLDERING FOOTPRINT\*

DIMENSIONS: INCHES

\*For additional information on our Pb-Free strategy and soldering details, please download the **onsemi** Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.
