

General Description

The MAX700/MAX701/MAX702 are supervisory circuits used to monitor the power supplies in microprocessor (μ P) and digital systems. The $\overline{\text{RESET}}$ /RESET outputs of the MAX700/MAX701/MAX702 are guaranteed to be in the correct state for V_{CC} voltages down to +1V (Figure 4). They provide excellent circuit reliability and low cost by eliminating external components and adjustments when used with +5V-powered circuits.

The MAX702 is the simplest part in the family. When V_{CC} falls to 4.65V, $\overline{\text{RESET}}$ goes low. The MAX702 also provides a debounced manual-reset input. The MAX701 performs the same functions but has both $\overline{\text{RESET}}$ and RESET outputs. Their primary function is to provide a system reset. Accordingly, an active reset signal is supplied for low supply voltages and for at least 200ms after the supply voltage reaches its operating value.

In addition to the features of the MAX701 and MAX702, the MAX700 provides preset or adjustable-voltage detection so thresholds other than 4.65V can be selected, and adjustable hysteresis. All parts are supplied in 8-pin PDIP and narrow-SO packages in commercial and extended temperature ranges.

Applications

- Computers
- Controllers
- Intelligent Instruments
- Critical μ P Power Monitoring

Features

- Min 200ms $\overline{\text{RESET}}$ Pulse on Power-Up, Power-Down, and During Low-Voltage Conditions
- Reset Threshold Factory Trimmed for +5V Systems
- No External Components or Adjustments with +5V-Powered Circuits
- Debounced Manual-Reset Input
- Preset or Adjustable-Voltage Detection (MAX700)
- Adjustable Hysteresis (MAX700)
- 8-Pin PDIP and Narrow-SO Packages

Absolute Maximum Ratings

V_{CC} -0.3V to +15.5V
 Voltage (with respect to GND) at RESET, RESET,
 HYST, CTL, SENSE -0.3V to V_{CC}
 Operating Temperature Range
 C Suffix 0°C to +70°C
 E Suffix -40°C to +85°C

Rate of Rise, V_{CC} 100V/μs
 Power Dissipation, Any Package 380mW
 Storage Temperature Range -55°C to +150°C
 Lead Temperature (soldering, 10s) +300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Pin Description

PIN			NAME	FUNCTION
MAX700	MAX701	MAX702		
1	1	1	MR	Input for Manual Pushbutton Reset. Has internal 5 μ A pullup. Low input activates the RESET/RESET outputs.
2	—	—	SENSE	The voltage-sense input when CTL = V _{CC} . Its threshold is 1.29V. SENSE always remains connected to the internal comparator. So, when V _{CC} is being monitored internally (CTL = GND), SENSE should be left open circuit.
3	—	—	HYST	Normally NOT used when voltage is monitored through V _{CC} (CTL = GND). When monitoring through SENSE (CTL = V _{CC}), HYST allows hysteresis to be added, reducing noise and spurious reset activity (Figure 3). HYST turns on 5 μ s before the RESET/RESET outputs are activated, and its on-resistance to GND is typically 1k Ω .
4	4	3	GND	Ground
5	6	7	RESET	Goes low when V _{CC} falls below 4.65V, or when CTL = V _{CC} on the MAX700 goes low when SENSE falls below 1.29V.
6	5	—	RESET	Inverted Version of RESET
7	—	—	CTL	When CTL = GND, V _{CC} is monitored by the reset circuit. When CTL = V _{CC} , V _{CC} is ignored and SENSE is monitored, allowing the threshold to be set with external resistors.
8	8	2	V _{CC}	Chip Power and +5V Sensing Input (When CTL = GND on MAX700)
—	2, 3, 7	4, 5, 6, 8	N.C.	No Connection
