## 72-Mbit (2 M × 36/4 M × 18/1 M × 72) Pipelined SRAM with NoBL™ Architecture

### Features

- Pin-compatible and functionally equivalent to ZBT™
- Supports 250 MHz bus operations with zero wait states
  - Available speed grades are 250, 200, and 167 MHz
- Internally self timed output buffer control to eliminate the need to use asynchronous OE
- Fully registered (inputs and outputs) for pipelined operation
- Byte Write capability
- Single 3.3 V power supply
- 3.3 V/2.5 V I/O power supply
- Fast clock-to-output time
  - 3.0 ns (for 250 MHz device)
- Clock Enable ( $\overline{\text{CEN}}$ ) pin to suspend operation
- Synchronous self timed writes
- CY7C1470BV33, CY7C1472BV33 available in JEDEC-standard Pb-free 100-pin TQFP, Pb-free and non-Pb-free 165-ball FBGA package. CY7C1474BV33 available in Pb-free and non-Pb-free 209-ball FBGA package
- IEEE 1149.1 JTAG Boundary Scan compatible
- Burst capability – linear or interleaved burst order
- “ZZ” Sleep Mode option and Stop Clock option

### Functional Description

The CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 are 3.3 V, 2 M × 36/4 M × 18/1 M × 72 Synchronous pipelined burst SRAMs with No Bus Latency™ (NoBL™) logic, respectively. They are designed to support unlimited true back-to-back read or write operations with no wait states. The CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 are equipped with the advanced (NoBL) logic required to enable consecutive read or write operations with data being transferred on every clock cycle. This feature dramatically improves the throughput of data in systems that require frequent read or write transitions. The CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 are pin compatible and functionally equivalent to ZBT devices.

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. The clock input is qualified by the Clock Enable (CEN) signal, which when deasserted suspends operation and extends the previous clock cycle.

Write operations are controlled by the Byte Write Selects ( $\text{BW}_a$ – $\text{BW}_d$  for CY7C1470BV33,  $\text{BW}_a$ – $\text{BW}_b$  for CY7C1472BV33, and  $\text{BW}_a$ – $\text{BW}_h$  for CY7C1474BV33) and a Write Enable (WE) input. All writes are conducted with on-chip synchronous self timed write circuitry.

Three synchronous Chip Enables ( $\overline{\text{CE}}_1$ ,  $\text{CE}_2$ ,  $\overline{\text{CE}}_3$ ) and an asynchronous Output Enable ( $\overline{\text{OE}}$ ) provide for easy bank selection and output tri-state control. To avoid bus contention, the output drivers are synchronously tri-stated during the data portion of a write sequence.

## Pin Definitions

Pin Name	I/O Type	Pin Description
A <sub>0</sub> , A <sub>1</sub> , A	Input-Synchronous	<b>Address Inputs Used to Select One of the Address Locations.</b> Sampled at the rising edge of the CLK.
$\overline{BW}_a$ , $\overline{BW}_b$ , $\overline{BW}_c$ , $\overline{BW}_d$ , $\overline{BW}_e$ , $\overline{BW}_f$ , $\overline{BW}_g$ , $\overline{BW}_h$	Input-Synchronous	<b>Byte Write Select Inputs, Active LOW.</b> Qualified with $\overline{WE}$ to conduct writes to the SRAM. Sampled on the rising edge of CLK. $\overline{BW}_a$ controls DQ <sub>a</sub> and DQP <sub>a</sub> , $\overline{BW}_b$ controls DQ <sub>b</sub> and DQP <sub>b</sub> , $\overline{BW}_c$ controls DQ <sub>c</sub> and DQP <sub>c</sub> , $\overline{BW}_d$ controls DQ <sub>d</sub> and DQP <sub>d</sub> , $\overline{BW}_e$ controls DQ <sub>e</sub> and DQP <sub>e</sub> , $\overline{BW}_f$ controls DQ <sub>f</sub> and DQP <sub>f</sub> , $\overline{BW}_g$ controls DQ <sub>g</sub> and DQP <sub>g</sub> , $\overline{BW}_h$ controls DQ <sub>h</sub> and DQP <sub>h</sub> .
$\overline{WE}$	Input-Synchronous	<b>Write Enable Input, Active LOW.</b> Sampled on the rising edge of CLK if $\overline{CEN}$ is active LOW. This signal must be asserted LOW to initiate a write sequence.
ADV/LD	Input-Synchronous	<b>Advance/Load Input Used to Advance the On-chip Address Counter or Load a New Address.</b> When HIGH (and $\overline{CEN}$ is asserted LOW) the internal burst counter is advanced. When LOW, a new address can be loaded into the device for an access. After being deselected, ADV/LD must be driven LOW to load a new address.
CLK	Input-Clock	<b>Clock Input.</b> Used to capture all synchronous inputs to the device. CLK is qualified with $\overline{CEN}$ . CLK is only recognized if $\overline{CEN}$ is active LOW.
CE <sub>1</sub>	Input-Synchronous	<b>Chip Enable 1 Input, Active LOW.</b> Sampled on the rising edge of CLK. Used in conjunction with CE <sub>2</sub> and CE <sub>3</sub> to select or deselect the device.
CE <sub>2</sub>	Input-Synchronous	<b>Chip Enable 2 Input, Active HIGH.</b> Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and CE <sub>3</sub> to select or deselect the device.
$\overline{CE}_3$	Input-Synchronous	<b>Chip Enable 3 Input, Active LOW.</b> Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and CE <sub>2</sub> to select or deselect the device.
OE	Input-Asynchronous	<b>Output Enable, Active LOW.</b> Combined with the synchronous logic block inside the device to control the direction of the I/O pins. When LOW, the I/O pins are enabled to behave as outputs. When deasserted HIGH, I/O pins are tri-stated, and act as input data pins. OE is masked during the data portion of a write sequence, during the first clock when emerging from a deselected state and when the device has been deselected.
$\overline{CEN}$	Input-Synchronous	<b>Clock Enable Input, Active LOW.</b> When asserted LOW the clock signal is recognized by the SRAM. When deasserted HIGH the clock signal is masked. Since deasserting $\overline{CEN}$ does not deselect the device, $\overline{CEN}$ can be used to extend the previous cycle when required.
DQ <sub>s</sub>	I/O-Synchronous	<b>Bidirectional Data I/O Lines.</b> As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by A <sub>[17:0]</sub> during the previous clock rise of the read cycle. The direction of the pins is controlled by OE and the internal control logic. When OE is asserted LOW, the pins can behave as outputs. When HIGH, DQ <sub>a</sub> –DQ <sub>d</sub> are placed in a tri-state condition. The outputs are automatically tri-stated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of OE.
DQP <sub>x</sub>	I/O-Synchronous	<b>Bidirectional Data Parity I/O Lines.</b> Functionally, these signals are identical to DQ <sub>x</sub> . During write sequences, DQP <sub>a</sub> is controlled by $\overline{BW}_a$ , DQP <sub>b</sub> is controlled by $\overline{BW}_b$ , DQP <sub>c</sub> is controlled by $\overline{BW}_c$ , and DQP <sub>d</sub> is controlled by $\overline{BW}_d$ , DQP <sub>e</sub> is controlled by $\overline{BW}_e$ , DQP <sub>f</sub> is controlled by $\overline{BW}_f$ , DQP <sub>g</sub> is controlled by $\overline{BW}_g$ , DQP <sub>h</sub> is controlled by $\overline{BW}_h$ .
MODE	Input Strap Pin	<b>Mode Input.</b> Selects the burst order of the device. Tied HIGH selects the interleaved burst order. Pulled LOW selects the linear burst order. MODE must not change states during operation. When left floating MODE defaults HIGH, to an interleaved burst order.
TDO	JTAG Serial Output Synchronous	<b>Serial Data Out to the JTAG Circuit.</b> Delivers data on the negative edge of TCK.
TDI	JTAG Serial Input Synchronous	<b>Serial Data In to the JTAG Circuit.</b> Sampled on the rising edge of TCK.

## Pin Definitions (continued)

Pin Name	I/O Type	Pin Description
TMS	Test Mode Select Synchronous	<b>This pin Controls the Test Access Port State Machine.</b> Sampled on the rising edge of TCK.
TCK	JTAG Clock	<b>Clock Input to the JTAG Circuitry.</b>
V <sub>DD</sub>	Power Supply	<b>Power Supply Inputs to the Core of the Device.</b>
V <sub>DDQ</sub>	I/O Power Supply	<b>Power Supply for the I/O Circuitry.</b>
V <sub>SS</sub>	Ground	<b>Ground for the Device.</b> Should be connected to ground of the system.
NC	–	<b>No Connects.</b> This pin is not connected to the die.
NC(144M, 288M, 576M, 1G)	–	<b>These Pins are Not Connected.</b> They are used for expansion to the 144M, 288M, 576M, and 1G densities.
ZZ	Input-Asynchronous	<b>ZZ “Sleep” Input.</b> This active HIGH input places the device in a non-time critical “sleep” condition with data integrity preserved. During normal operation, this pin must be LOW or left floating. ZZ pin has an internal pull-down.

## Functional Overview

The CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 are synchronous-pipelined Burst NoBL SRAMs designed specifically to eliminate wait states during read or write transitions. All synchronous inputs pass through input registers controlled by the rising edge of the clock. The clock signal is qualified with the Clock Enable input signal ( $\overline{\text{CEN}}$ ). If  $\overline{\text{CEN}}$  is HIGH, the clock signal is not recognized and all internal states are maintained. All synchronous operations are qualified with  $\overline{\text{CEN}}$ . All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise ( $t_{\text{CO}}$ ) is 3.0 ns (250 MHz device).

Accesses can be initiated by asserting all three Chip Enables ( $\text{CE}_1$ ,  $\text{CE}_2$ ,  $\text{CE}_3$ ) active at the rising edge of the clock. If  $\overline{\text{CEN}}$  is active LOW and  $\text{ADV/LD}$  is asserted LOW, the address presented to the device is latched. The access can either be a read or write operation, depending on the status of the Write Enable ( $\overline{\text{WE}}$ ).  $\text{BW}_{[\text{x}]}$  can be used to conduct Byte Write operations.

Write operations are qualified by the Write Enable ( $\overline{\text{WE}}$ ). All writes are simplified with on-chip synchronous self timed write circuitry.

Three synchronous Chip Enables ( $\overline{\text{CE}}_1$ ,  $\text{CE}_2$ ,  $\overline{\text{CE}}_3$ ) and an asynchronous Output Enable ( $\overline{\text{OE}}$ ) simplify depth expansion. All operations (reads, writes, and deselections) are pipelined.  $\text{ADV/LD}$  must be driven LOW after the device has been deselected to load a new address for the next operation.

### Single Read Accesses

A read access is initiated when the following conditions are satisfied at clock rise: (1)  $\overline{\text{CEN}}$  is asserted LOW, (2)  $\text{CE}_1$ ,  $\text{CE}_2$ , and  $\text{CE}_3$  are ALL asserted active, (3) the input signal  $\overline{\text{WE}}$  is deasserted HIGH, and (4)  $\text{ADV/LD}$  is asserted LOW. The address presented to the address inputs is latched into the Address Register and presented to the memory core and control logic. The control logic determines that a read access is in progress and allows the requested data to propagate to the input

of the output register. At the rising edge of the next clock the requested data is allowed to propagate through the output register and onto the data bus within 3.0 ns (250 MHz device) provided  $\overline{\text{OE}}$  is active LOW. After the first clock of the read access the output buffers are controlled by  $\overline{\text{OE}}$  and the internal control logic.  $\overline{\text{OE}}$  must be driven LOW to drive out the requested data. During the second clock, a subsequent operation (read, write, or deselect) can be initiated. Deselecting the device is also pipelined. Therefore, when the SRAM is deselected at clock rise by one of the chip enable signals, its output tri-states following the next clock rise.

### Burst Read Accesses

The CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 have an on-chip burst counter that enables the user to supply a single address and conduct up to four reads without reasserting the address inputs.  $\text{ADV/LD}$  must be driven LOW to load a new address into the SRAM, as described in the section [Single Read Accesses](#). The sequence of the burst counter is determined by the MODE input signal. A LOW input on MODE selects a linear burst mode, a HIGH selects an interleaved burst sequence. Both burst counters use A0 and A1 in the burst sequence, and wraps around when incremented sufficiently. A HIGH input on  $\text{ADV/LD}$  increments the internal burst counter regardless of the state of chip enables inputs or  $\overline{\text{WE}}$ .  $\overline{\text{WE}}$  is latched at the beginning of a burst cycle. Therefore, the type of access (read or write) is maintained throughout the burst sequence.

### Single Write Accesses

Write accesses are initiated when the following conditions are satisfied at clock rise: (1)  $\overline{\text{CEN}}$  is asserted LOW, (2)  $\text{CE}_1$ ,  $\text{CE}_2$ , and  $\text{CE}_3$  are all asserted active, and (3) the signal  $\overline{\text{WE}}$  is asserted LOW. The address presented to the address inputs is loaded into the Address Register. The write signals are latched into the Control Logic block.

On the subsequent clock rise the data lines are automatically tri-stated regardless of the state of the  $\overline{\text{OE}}$  input signal. This allows the external logic to present the data on DQ and DQP ( $\text{DQ}_{\text{a,b,c,d}}$ / $\text{DQP}_{\text{a,b,c,d}}$  for CY7C1470BV33,  $\text{DQ}_{\text{a,b}}$ / $\text{DQP}_{\text{a,b}}$  for

CY7C1472BV33, and  $DQ_{a,b,c,d,e,f,g,h}/DQP_{a,b,c,d,e,f,g,h}$  for CY7C1474BV33). In addition, the address for the subsequent access (read, write, or deselect) is latched into the Address Register (provided the appropriate control signals are asserted).

On the next clock rise the data presented to DQ and DQP ( $DQ_{a,b,c,d}/DQP_{a,b,c,d}$  for CY7C1470BV33,  $DQ_{a,b}/DQP_{a,b}$  for CY7C1472BV33, and  $DQ_{a,b,c,d,e,f,g,h}/DQP_{a,b,c,d,e,f,g,h}$  for CY7C1474BV33) (or a subset for byte write operations, see [Partial Write Cycle Description on page 12](#) for details) inputs is latched into the device and the write is complete.

The data written during the Write operation is controlled by  $\overline{BW}$  ( $\overline{BW}_{a,b,c,d}$  for CY7C1470BV33,  $\overline{BW}_{a,b}$  for CY7C1472BV33, and  $\overline{BW}_{a,b,c,d,e,f,g,h}$  for CY7C1474BV33) signals. The CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 provides Byte Write capability that is described in [Partial Write Cycle Description on page 12](#). Asserting the Write Enable input ( $\overline{WE}$ ) with the selected  $\overline{BW}$  input selectively writes to only the desired bytes. Bytes not selected during a Byte Write operation remain unaltered. A synchronous self timed write mechanism has been provided to simplify the write operations. Byte Write capability has been included to greatly simplify read, modify, or write sequences, which can be reduced to simple Byte Write operations.

Because the CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 are common I/O devices, data must not be driven into the device while the outputs are active. The  $\overline{OE}$  can be deasserted HIGH before presenting data to the DQ and DQP ( $DQ_{a,b,c,d}/DQP_{a,b,c,d}$  for CY7C1470BV33,  $DQ_{a,b}/DQP_{a,b}$  for CY7C1472BV33, and  $DQ_{a,b,c,d,e,f,g,h}/DQP_{a,b,c,d,e,f,g,h}$  for CY7C1474BV33) inputs. Doing so tri-states the output drivers. As a safety precaution, DQ and DQP ( $DQ_{a,b,c,d}/DQP_{a,b,c,d}$  for CY7C1470BV33,  $DQ_{a,b}/DQP_{a,b}$  for CY7C1472BV33, and  $DQ_{a,b,c,d,e,f,g,h}/DQP_{a,b,c,d,e,f,g,h}$  for CY7C1474BV33) are automatically tri-stated during the data portion of a write cycle, regardless of the state of  $\overline{OE}$ .

### Burst Write Accesses

The CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 has an on-chip burst counter that enables the user to supply a single address and conduct up to four write operations without reasserting the address inputs.  $\overline{ADV}/\overline{LD}$  must be driven LOW to load the initial address, as described in the section [Single Write](#)

[Accesses on page 9](#). When  $\overline{ADV}/\overline{LD}$  is driven HIGH on the subsequent clock rise, the Chip Enables ( $\overline{CE}_1$ ,  $\overline{CE}_2$ , and  $\overline{CE}_3$ ) and  $\overline{WE}$  inputs are ignored and the burst counter is incremented. The correct  $\overline{BW}$  ( $\overline{BW}_{a,b,c,d}$  for CY7C1470BV33,  $\overline{BW}_{a,b}$  for CY7C1472BV33, and  $\overline{BW}_{a,b,c,d,e,f,g,h}$  for CY7C1474BV33) inputs must be driven in each cycle of the burst write to write the correct bytes of data.

### Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation “sleep” mode. Two clock cycles are required to enter into or exit from this “sleep” mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the “sleep” mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected before entering the “sleep” mode.  $\overline{CE}_1$ ,  $\overline{CE}_2$ , and  $\overline{CE}_3$ , must remain inactive for the duration of  $t_{ZZREC}$  after the ZZ input returns LOW.

### Interleaved Burst Address Table

(MODE = Floating or  $V_{DD}$ )

First Address A1:A0	Second Address A1:A0	Third Address A1:A0	Fourth Address A1:A0
00	01	10	11
01	00	11	10
10	11	00	01
11	10	01	00

### Linear Burst Address Table

(MODE = GND)

First Address A1:A0	Second Address A1:A0	Third Address A1:A0	Fourth Address A1:A0
00	01	10	11
01	10	11	00
10	11	00	01
11	00	01	10

### ZZ Mode Electrical Characteristics

Parameter	Description	Test Conditions	Min	Max	Unit
$I_{DDZZ}$	Sleep mode standby current	$ZZ \geq V_{DD} - 0.2 V$	–	120	mA
$t_{ZZS}$	Device operation to ZZ	$ZZ \geq V_{DD} - 0.2 V$	–	$2t_{CYC}$	ns
$t_{ZZREC}$	ZZ recovery time	$ZZ \leq 0.2 V$	$2t_{CYC}$	–	ns
$t_{ZZI}$	ZZ active to sleep current	This parameter is sampled	–	$2t_{CYC}$	ns
$t_{RZZI}$	ZZ Inactive to exit sleep current	This parameter is sampled	0	–	ns

## Truth Table

The truth table for CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 follows. [1, 2, 3, 4, 5, 6, 7]

Operation	Address Used	$\overline{CE}$	ZZ	ADV/LD	$\overline{WE}$	$\overline{BW}_x$	$\overline{OE}$	$\overline{CEN}$	CLK	DQ
Deselect Cycle	None	H	L	L	X	X	X	L	L–H	Tri-State
Continue Deselect Cycle	None	X	L	H	X	X	X	L	L–H	Tri-State
Read Cycle (Begin Burst)	External	L	L	L	H	X	L	L	L–H	Data Out (Q)
Read Cycle (Continue Burst)	Next	X	L	H	X	X	L	L	L–H	Data Out (Q)
NOP/Dummy Read (Begin Burst)	External	L	L	L	H	X	H	L	L–H	Tri-State
Dummy Read (Continue Burst)	Next	X	L	H	X	X	H	L	L–H	Tri-State
Write Cycle (Begin Burst)	External	L	L	L	L	L	X	L	L–H	Data In (D)
Write Cycle (Continue Burst)	Next	X	L	H	X	L	X	L	L–H	Data In (D)
NOP/Write Abort (Begin Burst)	None	L	L	L	L	H	X	L	L–H	Tri-State
Write Abort (Continue Burst)	Next	X	L	H	X	H	X	L	L–H	Tri-State
Ignore Clock Edge (Stall)	Current	X	L	X	X	X	X	H	L–H	-
Sleep Mode	None	X	H	X	X	X	X	X	X	Tri-State

### Notes

1. X = "Don't Care", H = Logic HIGH, L = Logic LOW,  $\overline{CE}$  stands for ALL Chip Enables active.  $\overline{BW}_x = 0$  signifies at least one Byte Write Select is active,  $\overline{BW}_x$  = Valid signifies that the desired byte write selects are asserted, see [Partial Write Cycle Description on page 12](#) for details.
2. Write is defined by  $\overline{WE}$  and  $\overline{BW}_{[a:d]}$ . See [Partial Write Cycle Description on page 12](#) for details.
3. When a write cycle is detected, all IOs are tri-stated, even during **Byte Writes**.
4. The DQ and DQP pins are controlled by the current cycle and the  $\overline{OE}$  signal.
5.  $\overline{CEN} = H$  inserts wait states.
6. Device powers up deselected with the IOs in a tri-state condition, regardless of  $\overline{OE}$ .
7.  $\overline{OE}$  is asynchronous and is not sampled with the clock rise. It is masked internally during Write cycles. During a read cycle  $DQ_s$  and  $DQP_{[a:d]}$  = tri-state when  $\overline{OE}$  is inactive or when the device is deselected, and  $DQ_s$  = data when  $\overline{OE}$  is active.

## Partial Write Cycle Description

The partial write cycle description for CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 follows. [8, 9, 10, 11]

Function (CY7C1470BV33)	$\overline{WE}$	$\overline{BW_d}$	$\overline{BW_c}$	$\overline{BW_b}$	$\overline{BW_a}$
Read	H	X	X	X	X
Write – No bytes written	L	H	H	H	H
Write Byte a – (DQ <sub>a</sub> and DQP <sub>a</sub> )	L	H	H	H	L
Write Byte b – (DQ <sub>b</sub> and DQP <sub>b</sub> )	L	H	H	L	H
Write Bytes b, a	L	H	H	L	L
Write Byte c – (DQ <sub>c</sub> and DQP <sub>c</sub> )	L	H	L	H	H
Write Bytes c, a	L	H	L	H	L
Write Bytes c, b	L	H	L	L	H
Write Bytes c, b, a	L	H	L	L	L
Write Byte d – (DQ <sub>d</sub> and DQP <sub>d</sub> )	L	L	H	H	H
Write Bytes d, a	L	L	H	H	L
Write Bytes d, b	L	L	H	L	H
Write Bytes d, b, a	L	L	H	L	L
Write Bytes d, c	L	L	L	H	H
Write Bytes d, c, a	L	L	L	H	L
Write Bytes d, c, b	L	L	L	L	H
Write All Bytes	L	L	L	L	L

Function (CY7C1472BV33)	$\overline{WE}$	$\overline{BW_b}$	$\overline{BW_a}$
Read	H	x	x
Write – No Bytes Written	L	H	H
Write Byte a – (DQ <sub>a</sub> and DQP <sub>a</sub> )	L	H	L
Write Byte b – (DQ <sub>b</sub> and DQP <sub>b</sub> )	L	L	H
Write Both Bytes	L	L	L

Function (CY7C1474BV33)	$\overline{WE}$	$\overline{BW_x}$
Read	H	x
Write – No Bytes Written	L	H
Write Byte X – (DQ <sub>x</sub> and DQP <sub>x</sub> )	L	L
Write All Bytes	L	All $\overline{BW} = L$

### Notes

8. X = "Don't Care", H = Logic HIGH, L = Logic LOW,  $\overline{CE}$  stands for ALL Chip Enables active.  $\overline{BW_x} = 0$  signifies at least one Byte Write Select is active,  $\overline{BW_x}$  = Valid signifies that the desired byte write selects are asserted, see [Partial Write Cycle Description on page 12](#) for details.

9. Write is defined by  $\overline{WE}$  and  $\overline{BW_{[a,d]}}$ . See [Partial Write Cycle Description on page 12](#) for details.

10. When a write cycle is detected, all I/Os are tri-stated, even during Byte Writes.

11. Table lists only a partial listing of the Byte Write combinations. Any combination of  $\overline{BW_{[a,d]}}$  is valid. Appropriate Write is based on which Byte Write is active.

## IEEE 1149.1 Serial Boundary Scan (JTAG)

The CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 incorporates a serial boundary scan test access port (TAP). This port operates in accordance with IEEE Standard 1149.1-1990 but does not have the set of functions required for full 1149.1 compliance. These functions from the IEEE specification are excluded because their inclusion places an added delay in the critical speed path of the SRAM. Note that the TAP controller functions in a manner that does not conflict with the operation of other devices using 1149.1 fully compliant TAPs. The TAP operates using JEDEC-standard 3.3 V or 2.5 V I/O logic levels.

The CY7C1470BV33, CY7C1472BV33, and CY7C1474BV33 contains a TAP controller, instruction register, boundary scan register, bypass register, and ID register.

### Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW ( $V_{SS}$ ) to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternately be connected to  $V_{DD}$  through a pull up resistor. TDO must be left unconnected. During power up, the device comes up in a reset state, which does not interfere with the operation of the device.

### Test Access Port (TAP)

#### Test Clock (TCK)

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

#### Test Mode Select (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. It is allowable to leave this ball unconnected if the TAP is not used. The ball is pulled up internally, resulting in a logic HIGH level.

#### Test Data-In (TDI)

The TDI ball is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. For information about loading the instruction register, see the [TAP Controller State Diagram](#). TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) of any register.

#### Test Data-Out (TDO)

The TDO output ball is used to serially clock data-out from the registers. The output is active depending upon the current state of the TAP state machine. The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register.

### Performing a TAP Reset

A RESET is performed by forcing TMS HIGH ( $V_{DD}$ ) for five rising edges of TCK. This RESET does not affect the operation of the SRAM and may be performed while the SRAM is operating.

During power up, the TAP is reset internally to ensure that TDO comes up in a High Z state.

### TAP Registers

Registers are connected between the TDI and TDO balls and scans data into and out of the SRAM test circuitry. Only one register can be selected at a time through the instruction register. Data is serially loaded into the TDI ball on the rising edge of TCK. Data is output on the TDO ball on the falling edge of TCK.

#### Instruction Register

Three bit instructions can be serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO balls as shown in the [TAP Controller Block Diagram on page 16](#). During power up, the instruction register is loaded with the IDCODE instruction. It is also loaded with the IDCODE instruction if the controller is placed in a reset state as described in the previous section.

When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary '01' pattern to enable fault isolation of the board-level serial test data path.

#### Bypass Register

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single bit register that can be placed between the TDI and TDO balls. This shifts data through the SRAM with minimal delay. The bypass register is set LOW ( $V_{SS}$ ) when the BYPASS instruction is executed.

#### Boundary Scan Register

The boundary scan register is connected to all the input and bidirectional balls on the SRAM.

The boundary scan register is loaded with the contents of the RAM I/O ring when the TAP controller is in the Capture-DR state and is then placed between the TDI and TDO balls when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD and SAMPLE Z instructions can be used to capture the contents of the I/O ring.

The Boundary Scan Order tables show the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI and the LSB is connected to TDO.

#### Identification (ID) Register

The ID register is loaded with a vendor-specific, 32 bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in [Identification Register Definitions on page 20](#).

### TAP Instruction Set

#### Overview

Eight different instructions are possible with the three bit instruction register. All combinations are listed in [Identification Codes on page 20](#). Three of these instructions are listed as

RESERVED and must not be used. The other five instructions are described in this section in detail.

The TAP controller used in this SRAM is not fully compliant to the 1149.1 convention because some of the mandatory 1149.1 instructions are not fully implemented.

The TAP controller cannot be used to load address data or control signals into the SRAM and cannot preload the I/O buffers. The SRAM does not implement the 1149.1 commands EXTEST or INTEST or the PRELOAD portion of SAMPLE/PRELOAD; rather, it performs a capture of the I/O ring when these instructions are executed.

Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO balls. To execute the instruction after it is shifted in, the TAP controller is moved into the Update-IR state.

#### EXTEST

EXTEST is a mandatory 1149.1 instruction which is executed whenever the instruction register is loaded with all 0s. EXTEST is not implemented in this SRAM TAP controller, and therefore this device is not compliant to 1149.1. The TAP controller does recognize an all-0 instruction.

When an EXTEST instruction is loaded into the instruction register, the SRAM responds as if a SAMPLE/PRELOAD instruction has been loaded. There is one difference between the two instructions. Unlike the SAMPLE/PRELOAD instruction, EXTEST places the SRAM outputs in a High Z state.

#### IDCODE

The IDCODE instruction loads a vendor-specific, 32 bit code into the instruction register. It also places the instruction register between the TDI and TDO balls and shifts the IDCODE out of the device when the TAP controller enters the Shift-DR state.

The IDCODE instruction is loaded into the instruction register during power up or whenever the TAP controller is in a test logic reset state.

#### SAMPLE Z

The SAMPLE Z instruction connects the boundary scan register between the TDI and TDO balls when the TAP controller is in a Shift-DR state. It also places all SRAM outputs into a High Z state.

#### SAMPLE/PRELOAD

SAMPLE/PRELOAD is a 1149.1 mandatory instruction. The PRELOAD portion of this instruction is not implemented, so the device TAP controller is not fully 1149.1 compliant.

When the SAMPLE/PRELOAD instruction is loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the inputs and bidirectional balls is captured in the boundary scan register.

The user must be aware that the TAP controller clock can only operate at a frequency up to 20 MHz, while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that during the Capture-DR state, an input or output may undergo a transition. The TAP may then try to capture a signal while in transition (metastable state). This does not harm the device, but there is no guarantee as to the value that is captured. Repeatable results may not be possible.

To guarantee that the boundary scan register captures the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller's capture setup plus hold time ( $t_{CS}$  plus  $t_{CH}$ ).

The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is still possible to capture all other signals and simply ignore the value of the CLK captured in the boundary scan register.

After the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO balls.

Note that since the PRELOAD part of the command is not implemented, putting the TAP to the Update-DR state while performing a SAMPLE/PRELOAD instruction has the same effect as the Pause-DR command.

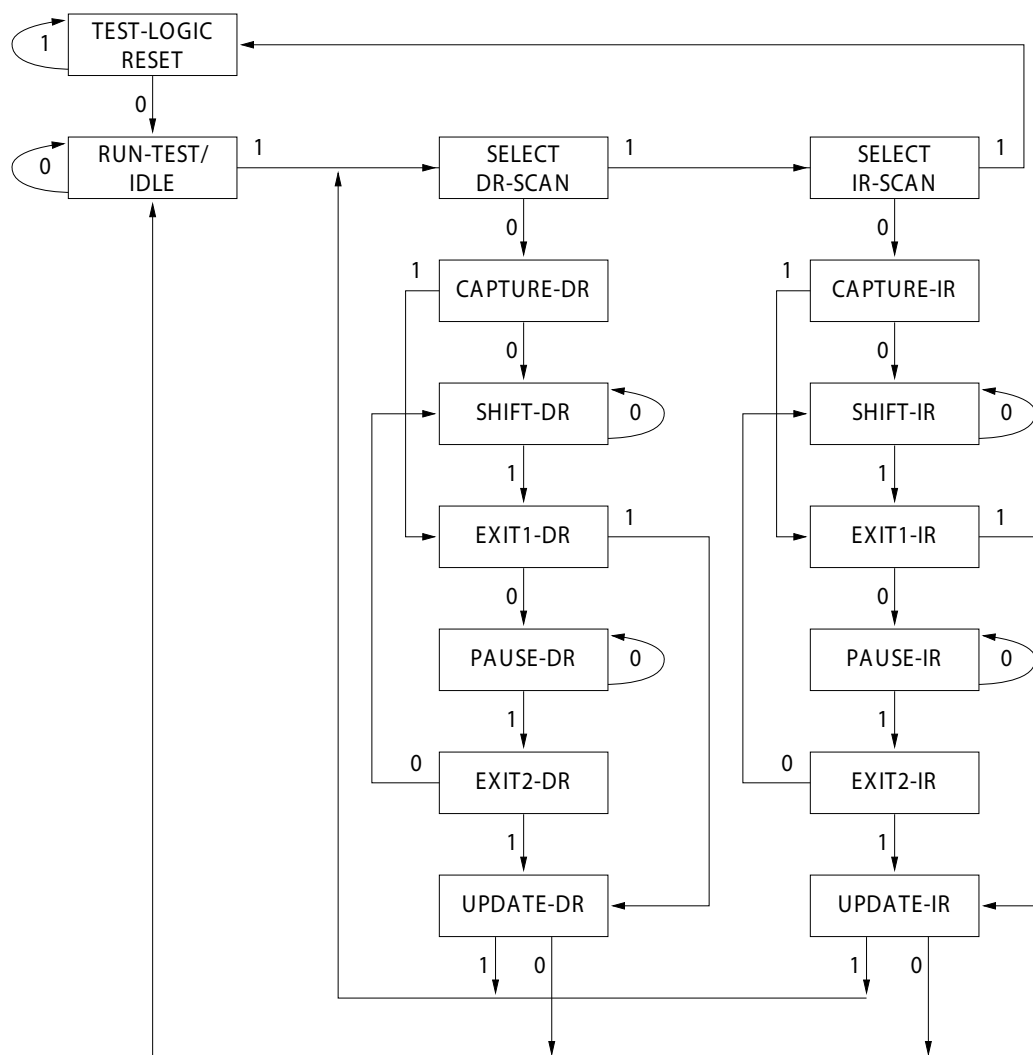

#### BYPASS

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO balls. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.

#### Reserved

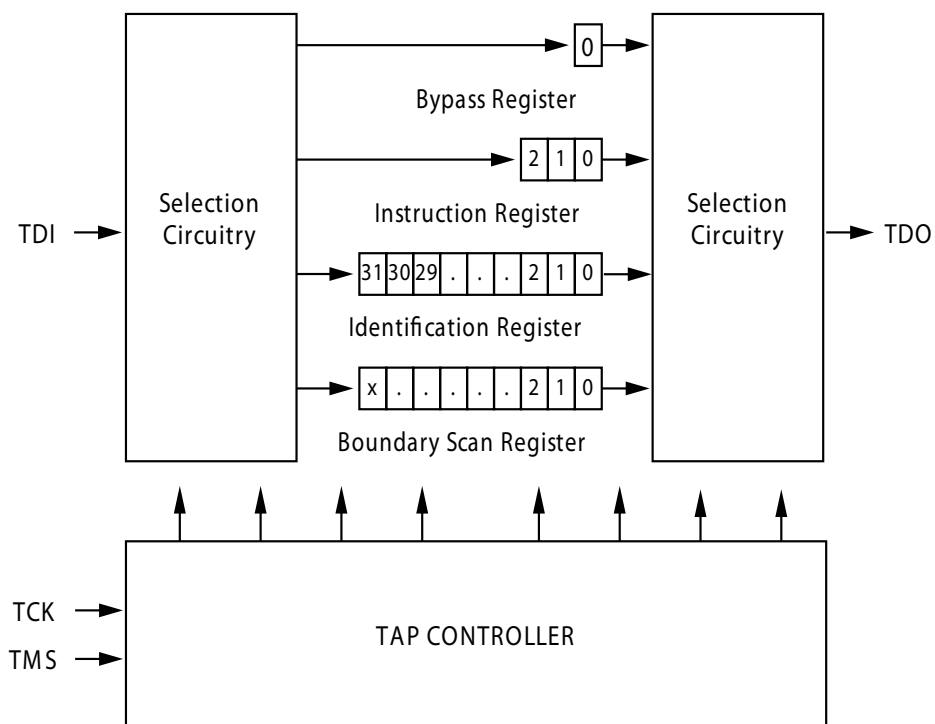

These instructions are not implemented but are reserved for future use. Do not use these instructions.

## TAP Controller State Diagram

The 0/1 next to each state represents the value of TMS at the rising edge of TCK.

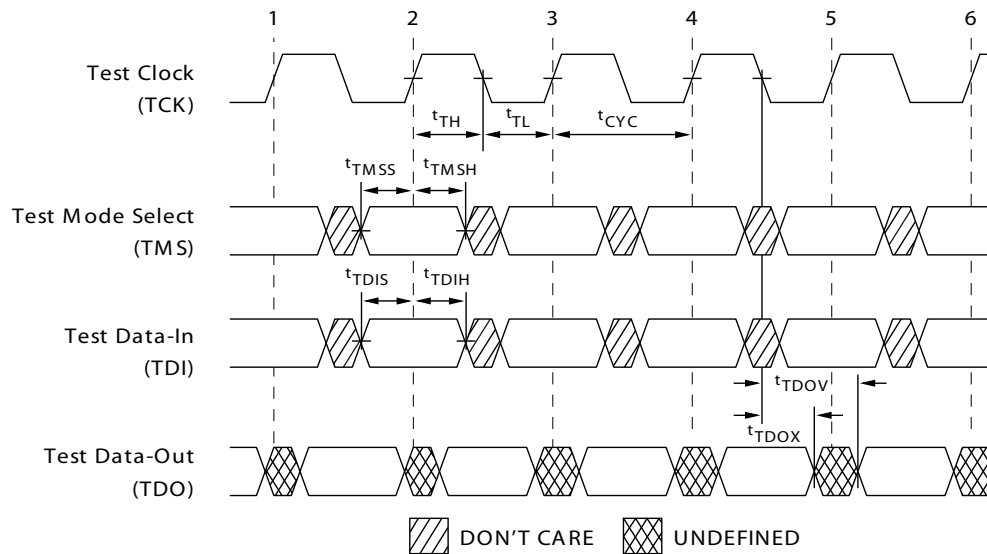

## TAP Controller Block Diagram

## TAP Timing

**Figure 4. TAP Timing**

## TAP AC Switching Characteristics

Over the Operating Range

Parameter <sup>[12, 13]</sup>	Description	Min	Max	Unit
<b>Clock</b>				
$t_{TCYC}$	TCK Clock Cycle Time	50	–	ns
$t_{TF}$	TCK Clock Frequency	–	20	MHz
$t_{TH}$	TCK Clock HIGH time	20	–	ns
$t_{TL}$	TCK Clock LOW time	20	–	ns

Boundary Scan Order – 209-ball FBGA	–	–	110

## Identification Codes

Instruction	Code	Description
EXTEST	000	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM outputs to High Z state. This instruction is not 1149.1 compliant.
IDCODE	001	Loads the ID register with the vendor ID code and places the register between TDI and TDO. This operation does not affect SRAM operations.
SAMPLE Z	010	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM output drivers to a High Z state.
RESERVED	011	Do Not Use: This instruction is reserved for future use.
SAMPLE/PRELOAD	100	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Does not affect SRAM operation. This instruction does not implement 1149.1 preload function and is therefore not 1149.1 compliant.
RESERVED	101	Do Not Use: This instruction is reserved for future use.

### Note

15. Bit #24 is "1" in the ID Register Definitions for both 2.5 V and 3.3 V versions of this device.

## Boundary Scan Exit Order

## Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage Temperature ..... –65 °C to +150 °C

Ambient Temperature with  
Power Applied ..... –55 °C to +125 °C

Supply Voltage on  $V_{DD}$  Relative to GND ..... –0.5 V to +4.6 V

Supply Voltage on  $V_{DDQ}$  Relative to GND ..... –0.5 V to + $V_{DD}$

DC to Outputs in Tri-State ..... –0.5 V to  $V_{DDQ} + 0.5$  V

DC Input Voltage ..... –0.5 V to  $V_{DD} + 0.5$  V

Current into Outputs (LOW) ..... 20 mA

Static Discharge Voltage  
(MIL-STD-883, Method 3015) ..... > 2001V

Latch Up Current ..... > 200 mA

## Operating Range

Range	Ambient Temperature	$V_{DD}$	$V_{DDQ}$
Commercial	0 °C to +70 °C	3.3 V – 5% / +10%	2.5 V – 5% to $V_{DD}$
Industrial	–40 °C to +85 °C		

## Neutron Soft Error Immunity

Parameter	Description	Test Conditions	Typ	Max*	Unit
LSBU	Logical Single Bit Upsets	25 °C	361	394	FIT/Mb
LMBU	Logical Multi Bit Upsets	25 °C	0	0.01	FIT/Mb
SEL	Single Event Latch up	85 °C	0	0.1	FIT/Dev

\* No LMBU or SEL events occurred during testing; this column represents a statistical  $\chi^2$ , 95% confidence limit calculation. For more details refer to Application Note AN54908 "Accelerated Neutron SER Testing and Calculation of Terrestrial Failure Rates".

## Electrical Characteristics

Over the Operating Range

Parameter <sup>[16, 17]</sup>	Description	Test Conditions	Min	Max	Unit
$V_{DD}$	Power supply voltage		3.135	3.6	V
$V_{DDQ}$	I/O supply voltage	For 3.3 V I/O	3.135	$V_{DD}$	V
		For 2.5 V I/O	2.375	2.625	V
$V_{OH}$	Output HIGH voltage	For 3.3 V I/O, $I_{OH} = -4.0$ mA	2.4	–	V
		For 2.5 V I/O, $I_{OH} = -1.0$ mA	2.0	–	V
$V_{OL}$	Output LOW voltage	For 3.3 V I/O, $I_{OL} = 8.0$ mA	–	0.4	V
		For 2.5 V I/O, $I_{OL} = 1.0$ mA	–	0.4	V
$V_{IH}$	Input HIGH voltage <sup>[16]</sup>	For 3.3 V I/O	2.0	$V_{DD} + 0.3$	V
		For 2.5 V I/O	1.7	$V_{DD} + 0.3$	V
$V_{IL}$	Input LOW voltage <sup>[16]</sup>	For 3.3 V I/O	–0.3	0.8	V
		For 2.5 V I/O	–0.3	0.7	V
$I_X$	Input leakage current except ZZ and MODE	$GND \leq V_I \leq V_{DDQ}$	–5	5	$\mu$ A
	Input current of MODE	Input = $V_{SS}$	–30	–	$\mu$ A
		Input = $V_{DD}$	–	5	$\mu$ A
	Input current of ZZ	Input = $V_{SS}$	–5	–	$\mu$ A
		Input = $V_{DD}$	–	30	$\mu$ A
$I_{OZ}$	Output leakage current	$GND \leq V_I \leq V_{DDQ}$ , output disabled	–5	5	$\mu$ A

### Notes

16. Overshoot:  $V_{IH(AC)} < V_{DD} + 1.5$  V (pulse width less than  $t_{CYC}/2$ ). Undershoot:  $V_{IL(AC)} > -2$  V (pulse width less than  $t_{CYC}/2$ ).

17.  $T_{power\ up}$ : assumes a linear ramp from 0 V to  $V_{DD(min)}$  within 200 ms. During this time  $V_{IH} < V_{DD}$  and  $V_{DDQ} \leq V_{DD}$ .

## Electrical Characteristics (continued)

Over the Operating Range

Parameter <sup>[16, 17]</sup>	Description	Test Conditions		Min	Max	Unit
$I_{DD}^{[18]}$	$V_{DD}$ Operating Supply	$V_{DD} = \text{Max}, I_{OUT} = 0 \text{ mA}, f = f_{MAX} = 1/t_{CYC}$	4.0-ns cycle, 250 MHz	–	500	mA
			5.0-ns cycle, 200 MHz	–	500	mA
			6.0-ns cycle, 167 MHz	–	450	mA
$I_{SB1}$	Automatic CE power-down current – TTL Inputs	Max $V_{DD}$ , Device Deselected, $V_{IN} \geq V_{IH}$ or $V_{IN} \leq V_{IL}$ , $f = f_{MAX} = 1/t_{CYC}$	4.0-ns cycle, 250 MHz	–	245	mA
			5.0-ns cycle, 200 MHz	–	245	mA
			6.0-ns cycle, 167 MHz	–	245	mA
$I_{SB2}$	Automatic CE power-down current – CMOS Inputs	Max $V_{DD}$ , Device Deselected, $V_{IN} \leq 0.3 \text{ V}$ or $V_{IN} \geq V_{DDQ} - 0.3 \text{ V}$ , $f = 0$	All speed grades	–	120	mA
$I_{SB3}$	Automatic CE power-down current – CMOS Inputs	Max $V_{DD}$ , Device Deselected, $V_{IN} \leq 0.3 \text{ V}$ or $V_{IN} \geq V_{DDQ} - 0.3 \text{ V}$ , $f = f_{MAX} = 1/t_{CYC}$	4.0-ns cycle, 250 MHz	–	245	mA
			5.0-ns cycle, 200 MHz	–	245	mA
			6.0-ns cycle, 167 MHz	–	245	mA
$I_{SB4}$	Automatic CE Power Down Current – TTL Inputs	Max $V_{DD}$ , Device Deselected, $V_{IN} \geq V_{IH}$ or $V_{IN} \leq V_{IL}$ , $f = 0$	All speed grades	–	135	mA

### Note

18. The operation current is calculated with 50% read cycle and 50% write cycle.

## Capacitance

Parameter <sup>[19]</sup>	Description	Test Conditions	100-pin TQFP Max	165-ball FBGA Max	209-ball FBGA Max	Unit
C <sub>ADDRESS</sub>	Address input capacitance	T <sub>A</sub> = 25 °C, f = 1 MHz, V <sub>DD</sub> = 3.3 V, V <sub>DDQ</sub> = 2.5 V	6	6	6	pF
C <sub>DATA</sub>	Data input capacitance		5	5	5	pF
C <sub>CTRL</sub>	Control input capacitance		8	8	8	pF
C <sub>CLK</sub>	Clock input capacitance		6	6	6	pF
C <sub>IO</sub>	I/O capacitance		5	5	5	pF

## Thermal Resistance

Parameter <sup>[19]</sup>	Description	Test Conditions	100-pin TQFP Package	165-ball FBGA Package	209-ball FBGA Package	Unit
Θ <sub>JA</sub>	Thermal resistance (junction to ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, per EIA/JESD51.	24.63	16.3	15.2	°C/W
Θ <sub>JC</sub>	Thermal resistance (junction to case)		2.28	2.1	1.7	°C/W

## AC Test Loads and Waveforms

Figure 5. AC Test Loads and Waveforms

### 3.3 V I/O Test Load

### 2.5 V I/O Test Load

### Note

19. Tested initially and after any design or process changes that may affect these parameters.

## Switching Characteristics

Over the Operating Range

Parameter <sup>[20, 21]</sup>	Description	-250		-200		-167		Unit
		Min	Max	Min	Max	Min	Max	
$t_{Power}^{[22]}$	$V_{CC}$ (typical) to the first access read or write	1	–	1	–	1	–	ms
<b>Clock</b>								
$t_{CYC}$	Clock cycle time	4.0	–	5.0	–	6.0	–	ns
$F_{MAX}$	Maximum operating frequency	–	250	–	200	–	167	MHz
$t_{CH}$	Clock HIGH	2.0	–	2.0	–	2.2	–	ns
$t_{CL}$	Clock LOW	2.0	–	2.0	–	2.2	–	ns
<b>Output Times</b>								
$t_{CO}$	Data output valid after CLK rise	–	3.0	–	3.0	–	3.4	ns
$t_{OE\bar{V}}$	$\bar{OE}$ LOW to output valid	–	3.0	–	3.0	–	3.4	ns
$t_{DOH}$	Data output hold after CLK rise	1.3	–	1.3	–	1.5	–	ns
$t_{CHZ}$	Clock to high Z <sup>[23, 24, 25]</sup>	–	3.0	–	3.0	–	3.4	ns
$t_{CLZ}$	Clock to low Z <sup>[23, 24, 25]</sup>	1.3	–	1.3	–	1.5	–	ns
$t_{EOHZ}$	$\bar{OE}$ HIGH to output high Z <sup>[23, 24, 25]</sup>	–	3.0	–	3.0	–	3.4	ns
$t_{EOLZ}$	$\bar{OE}$ LOW to output low Z <sup>[23, 24, 25]</sup>	0	–	0	–	0	–	ns
<b>Setup Times</b>								
$t_{AS}$	Address setup before CLK rise	1.4	–	1.4	–	1.5	–	ns
$t_{DS}$	Data input setup before CLK rise	1.4	–	1.4	–	1.5	–	ns
$t_{CENS}$	$\bar{CEN}$ setup before CLK rise	1.4	–	1.4	–	1.5	–	ns
$t_{WES}$	$\bar{WE}$ , $\bar{BW}_x$ setup before CLK rise	1.4	–	1.4	–	1.5	–	ns
$t_{ALS}$	$\bar{ADV}/\bar{LD}$ setup before CLK rise	1.4	–	1.4	–	1.5	–	ns
$t_{CES}$	Chip select setup	1.4	–	1.4	–	1.5	–	ns
<b>Hold Times</b>								
$t_{AH}$	Address hold after CLK rise	0.4	–	0.4	–	0.5	–	ns
$t_{DH}$	Data input hold after CLK rise	0.4	–	0.4	–	0.5	–	ns
$t_{CENH}$	$\bar{CEN}$ hold after CLK rise	0.4	–	0.4	–	0.5	–	ns
$t_{WEH}$	$\bar{WE}$ , $\bar{BW}_x$ hold after CLK rise	0.4	–	0.4	–	0.5	–	ns
$t_{ALH}$	$\bar{ADV}/\bar{LD}$ hold after CLK rise	0.4	–	0.4	–	0.5	–	ns
$t_{CEH}$	Chip select hold after CLK rise	0.4	–	0.4	–	0.5	–	ns

### Notes

20. Timing reference is 1.5 V when  $V_{DDQ} = 3.3$  V and is 1.25 V when  $V_{DDQ} = 2.5$  V.

21. Test conditions shown in (a) of [Figure 5 on page 25](#) unless otherwise noted.

22. This part has an internal voltage regulator;  $t_{Power}$  is the time power is supplied above  $V_{DD}$  minimum initially, before a read or write operation can be initiated.

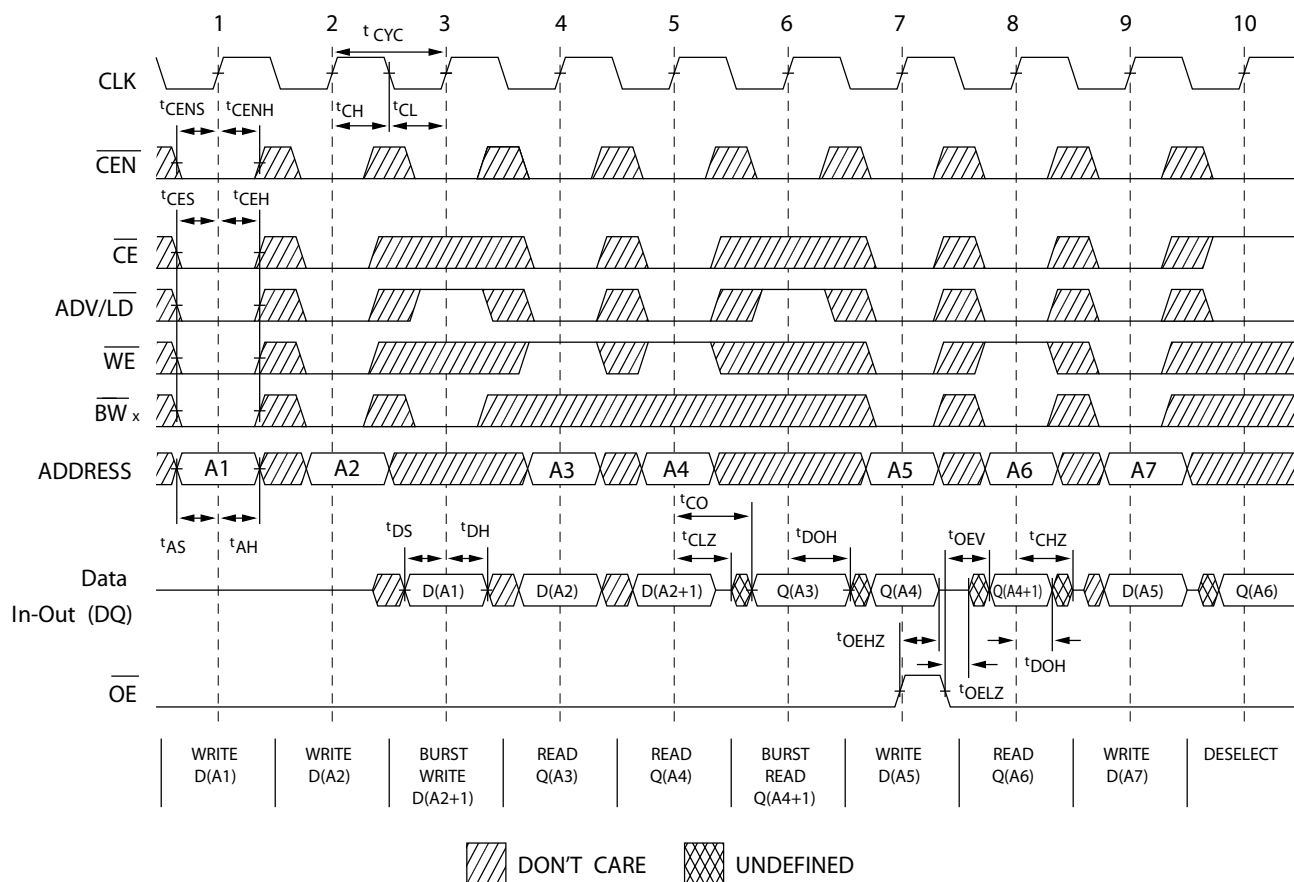

23.  $t_{CHZ}$ ,  $t_{CLZ}$ ,  $t_{EOLZ}$ , and  $t_{EOHZ}$  are specified with AC test conditions shown in (b) of [Figure 5 on page 25](#). Transition is measured  $\pm 200$  mV from steady-state voltage.

24. At any voltage and temperature,  $t_{EOHZ}$  is less than  $t_{EOLZ}$  and  $t_{CHZ}$  is less than  $t_{CLZ}$  to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve High Z before Low Z under the same system conditions.

25. This parameter is sampled and not 100% tested.

## Switching Waveforms

**Figure 6. Read/Write Timing** [26, 27, 28]

### Notes

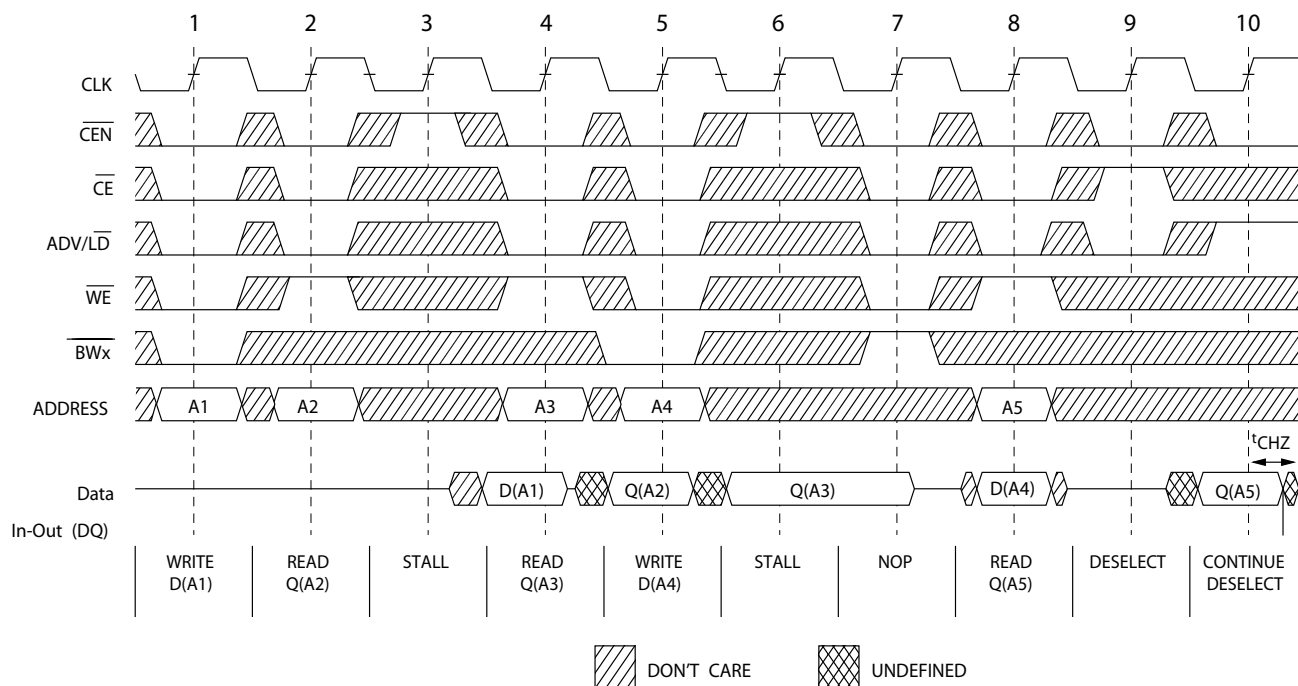

26. For this waveform ZZ is tied LOW.

27. When  $\overline{CE}$  is LOW,  $\overline{CE}_1$  is LOW,  $CE_2$  is HIGH, and  $\overline{CE}_3$  is LOW. When  $\overline{CE}$  is HIGH,  $\overline{CE}_1$  is HIGH,  $CE_2$  is LOW or  $\overline{CE}_3$  is HIGH.

28. Order of the Burst sequence is determined by the status of the MODE (0 = Linear, 1 = Interleaved). Burst operations are optional.

## Switching Waveforms (continued)

**Figure 7. NOP, STALL and DESELECT Cycles** [29, 30, 31]

**Figure 8. ZZ Mode Timing** [32, 33]

### Notes

29. For this waveform ZZ is tied LOW.

30. When  $\overline{CE}$  is LOW,  $\overline{CE}_1$  is LOW,  $\overline{CE}_2$  is HIGH, and  $\overline{CE}_3$  is LOW. When  $\overline{CE}$  is HIGH,  $\overline{CE}_1$  is HIGH,  $\overline{CE}_2$  is LOW or  $\overline{CE}_3$  is HIGH.

31. The IGNORE CLOCK EDGE or STALL cycle (Clock 3) illustrated  $\overline{CEN}$  being used to create a pause. A Write is not performed during this cycle.

32. Device must be deselected when entering ZZ mode. See [Truth Table on page 11](#) for all possible signal conditions to deselect the device.

33. IOs are in High Z when exiting ZZ sleep mode.

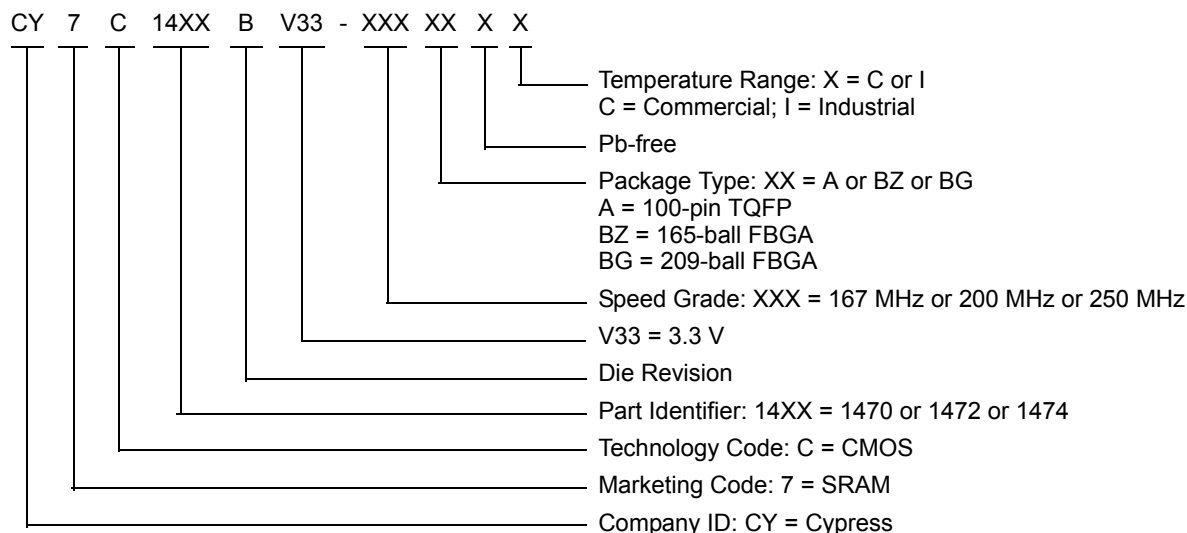

## Ordering Information

The table below contains only the parts that are currently available. If you don't see what you are looking for, please contact your local sales representative. For more information, visit the Cypress website at [www.cypress.com](http://www.cypress.com) and refer to the product summary page at <http://www.cypress.com/products>.

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives and distributors. To find the office closest to you, visit us at <http://www.cypress.com/go/datasheet/offices>.

Speed (MHz)	Ordering Code	Package Diagram	Part and Package Type	Operating Range

Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Any Source Code (software and/or firmware) is owned by Cypress Semiconductor Corporation (Cypress) and is protected by and subject to worldwide patent protection (United States and foreign), United States copyright laws and international treaty provisions. Cypress hereby grants to licensee a personal, non-exclusive, non-transferable license to copy, use, modify, create derivative works of, and compile the Cypress Source Code and derivative works for the sole purpose of creating custom software and or firmware in support of licensee product to be used only in conjunction with a Cypress integrated circuit as specified in the applicable agreement. Any reproduction, modification, translation, compilation, or representation of this Source Code except as specified above is prohibited without the express written permission of Cypress.

Disclaimer: CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes without further notice to the materials described herein. Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.
