

**VOLTAGE DETECTOR WITH SENSE PIN**[www.ablicinc.com](http://www.ablicinc.com)

© ABLIC Inc., 2014-2016

Rev.1.1\_03

The S-1002 Series is a high-accuracy voltage detector developed using CMOS technology. The detection voltage is fixed internally with an accuracy of  $\pm 1.0\%$  ( $-V_{\text{DET(S)}} \geq 2.2 \text{ V}$ ). It operates with current consumption of 500 nA typ.

Apart from the power supply pin, the detection voltage input pin (SENSE pin) is also prepared, so the output is stable even if the SENSE pin falls to 0 V.

Two output forms Nch open-drain output and CMOS output are available.

**■ Features**

- Detection voltage: 1.0 V to 5.0 V (0.1 V step)
- Detection voltage accuracy:  $\pm 1.0\%$  ( $2.2 \text{ V} \leq -V_{\text{DET(S)}} \leq 5.0 \text{ V}$ )  
 $\pm 22 \text{ mV}$  ( $1.0 \text{ V} \leq -V_{\text{DET(S)}} < 2.2 \text{ V}$ )
- Current consumption: 500 nA typ.
- Operation voltage range: 0.95 V to 10.0 V
- Hysteresis width:  $5\% \pm 2\%$
- Output form: Nch open-drain output (Active "L")  
CMOS output (Active "L")
- Operation temperature range:  $T_a = -40^\circ\text{C}$  to  $+85^\circ\text{C}$
- Lead-free (Sn 100%), halogen-free

**■ Applications**

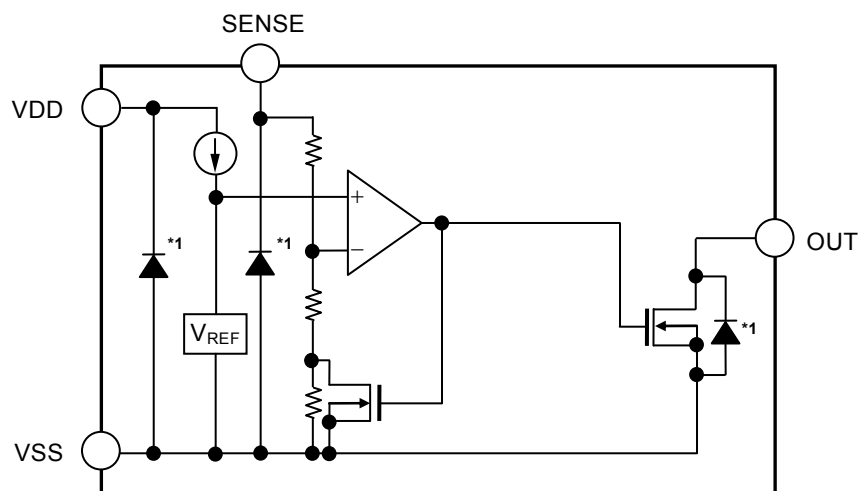

- Power supply monitor for microcomputer and reset for CPU
- Constant voltage power supply monitor for TV, Blu-ray recorder and home appliance
- Power supply monitor for portable devices such as notebook PC, digital still camera and mobile phone

**■ Packages**

- SOT-23-5
- SC-82AB

## ■ Product Name Structure

Users can select the output form, detection voltage value, and package type for the S-1002 Series.

Refer to "1. Product name" regarding the contents of product name, "2. Function list of product types" regarding the product types, "3. Packages" regarding the package drawings and "4. Product name list" regarding details of product name.

### 1. Product name

\*1. Refer to the tape drawing.

\*2. Refer to "■ Pin Configurations".

\*3. Refer to "2. Function list of product types".

\*4. If you request the product with output logic active "H", contact our sales office.

## ■ Explanation of Terms

### 1. Detection voltage ( $-V_{DET}$ )

The detection voltage is a voltage at which the output in **Figure 18** or **Figure 19** turns to "L". The detection voltage varies slightly among products of the same specification. The variation of detection voltage between the specified minimum ( $-V_{DET}$  min.) and the maximum ( $-V_{DET}$  max.) is called the detection voltage range (Refer to **Figure 16**).

Example: In the S-1002Cx18, the detection voltage is either one in the range of  $1.778\text{ V} \leq -V_{DET} \leq 1.822\text{ V}$ .  
 This means that some S-1002Cx18 have  $-V_{DET} = 1.778\text{ V}$  and some have  $-V_{DET} = 1.822\text{ V}$ .

### 2. Release voltage ( $+V_{DET}$ )

The release voltage is a voltage at which the output in **Figure 18** or **Figure 19** turns to "H". The release voltage varies slightly among products of the same specification. The variation of release voltage between the specified minimum ( $+V_{DET}$  min.) and the maximum ( $+V_{DET}$  max.) is called the release voltage range (Refer to **Figure 17**). The range is calculated from the actual detection voltage ( $-V_{DET}$ ) of a product and is in the range of  $-V_{DET} \times 1.03 \leq +V_{DET} \leq -V_{DET} \times 1.07$ .

Example: For the S-1002Cx18, the release voltage is either one in the range of  $1.832\text{ V} \leq +V_{DET} \leq 1.949\text{ V}$ .  
 This means that some S-1002Cx18 have  $+V_{DET} = 1.832\text{ V}$  and some have  $+V_{DET} = 1.949\text{ V}$ .

**Figure 16 Detection Voltage**

**Figure 17 Release Voltage**

**Figure 18 Test Circuit of Detection Voltage and Release Voltage (Nch open-drain output product)**

**Figure 19 Test Circuit of Detection Voltage and Release Voltage (CMOS output product)**

### 3. Hysteresis width ( $V_{HYS}$ )

The hysteresis width is the voltage difference between the detection voltage and the release voltage (the voltage at point B – the voltage at point A =  $V_{HYS}$  in "Figure 22 Timing Chart of S-1002 Series NA / NB Type" and "Figure 24 Timing Chart of S-1002 Series CA / CB Type"). Setting the hysteresis width between the detection voltage and the release voltage, prevents malfunction caused by noise on the input voltage.

### 4. Feed-through current

The feed-through current is a current that flows instantaneously to the VDD pin at the time of detection and release of a voltage detector. The feed-through current is large in CMOS output product, small in Nch open-drain output product.

### 5. Oscillation

In applications where an input resistor is connected (Figure 20), taking a CMOS output (active "L") product for example, the feed-through current which is generated when the output goes from "L" to "H" (at the time of release) causes a voltage drop equal to [feed-through current]  $\times$  [input resistance]. Since the VDD pin and the SENSE pin are shorted as in Figure 20, the SENSE pin voltage drops at the time of release. Then the SENSE pin voltage drops below the detection voltage and the output goes from "H" to "L". In this status, the feed-through current stops and its resultant voltage drop disappears, and the output goes from "L" to "H". The feed-through current is then generated again, a voltage drop appears, and repeating the process finally induces oscillation.

## ■ Operation

### 1. Basic operation

#### 1.1 S-1002 Series NA / NB type

- (1) When the power supply voltage ( $V_{DD}$ ) is the minimum operation voltage or higher, and the SENSE pin voltage ( $V_{SENSE}$ ) is the release voltage ( $+V_{DET}$ ) or higher, the Nch transistor is turned off to output  $V_{DD}$  ("H") when the output is pulled up. Since the Nch transistor (N1) is turned off, the input voltage to the comparator is  $\frac{(R_B + R_C) \cdot V_{SENSE}}{R_A + R_B + R_C}$ .
- (2) Even if  $V_{SENSE}$  decreases to  $+V_{DET}$  or lower,  $V_{DD}$  is output when  $V_{SENSE}$  is higher than the detection voltage ( $-V_{DET}$ ).  
 When  $V_{SENSE}$  decreases to  $-V_{DET}$  or lower (point A in **Figure 22**), the Nch transistor is turned on. And then  $V_{SS}$  ("L") is output from the OUT pin after the elapse of the detection delay time ( $t_{DET}$ ).  
 At this time, N1 is turned on, and the input voltage to the comparator is  $\frac{R_B \cdot V_{SENSE}}{R_A + R_B}$ .
- (3) Even if  $V_{SENSE}$  further decreases to the IC's minimum operation voltage or lower, the output from the OUT pin is stable when  $V_{DD}$  is minimum operation voltage or higher.
- (4) Even if  $V_{SENSE}$  exceeds  $-V_{DET}$ ,  $V_{SS}$  is output when  $V_{SENSE}$  is lower than  $+V_{DET}$ .
- (5) When  $V_{SENSE}$  increases to  $+V_{DET}$  or higher (point B in **Figure 22**), the Nch transistor is turned off. And then  $V_{DD}$  is output from the OUT pin after the elapse of the release delay time ( $t_{RESET}$ ) when the output is pulled up.

## 1.2 S-1002 Series CA / CB type

- (1) When the power supply voltage ( $V_{DD}$ ) is the minimum operation voltage or higher, and the SENSE pin voltage ( $V_{SENSE}$ ) is the release voltage ( $+V_{DET}$ ) or higher, the Nch transistor is turned off and the Pch transistor is turned on to output  $V_{DD}$  ("H"). Since the Nch transistor (N1) is turned off, the input voltage to the comparator is  $\frac{(R_B + R_C) \cdot V_{SENSE}}{R_A + R_B + R_C}$ .
- (2) Even if  $V_{SENSE}$  decreases to  $+V_{DET}$  or lower,  $V_{DD}$  is output when  $V_{SENSE}$  is higher than the detection voltage ( $-V_{DET}$ ).  
When  $V_{SENSE}$  decreases to  $-V_{DET}$  or lower (point A in **Figure 24**), the Nch transistor is turned on and the Pch transistor is turned off. And then  $V_{SS}$  ("L") is output from the OUT pin after the elapse of the detection delay time ( $t_{DET}$ ).  
At this time, N1 is turned on, and the input voltage to the comparator is  $\frac{R_B \cdot V_{SENSE}}{R_A + R_B}$ .
- (3) Even if  $V_{SENSE}$  further decreases to the IC's minimum operation voltage or lower, the output from the OUT pin is stable when  $V_{DD}$  is minimum operation voltage or higher.
- (4) Even if  $V_{SENSE}$  exceeds  $-V_{DET}$ ,  $V_{SS}$  is output when  $V_{SENSE}$  is lower than  $+V_{DET}$ .
- (5) When  $V_{SENSE}$  increases to  $+V_{DET}$  or higher (point B in **Figure 24**), the Nch transistor is turned off and the Pch transistor is turned on. And then  $V_{DD}$  is output from the OUT pin after the elapse of the release delay time ( $t_{RESET}$ ).

## 2. SENSE pin

### 2.1 Error when detection voltage is set externally

By connecting a node that was resistance-divided by the resistor ( $R_A$ ) and the resistor ( $R_B$ ) to the SENSE pin as seen in **Figure 25**, the detection voltage can be set externally.

For conventional products without the SENSE pin,  $R_A$  cannot be too large since the resistance-divided node must be connected to the VDD pin. This is because a feed-through current will flow through the VDD pin when it goes from detection to release, and if  $R_A$  is large, problems such as oscillation or larger error in the hysteresis width may occur.

In the S-1002 Series,  $R_A$  and  $R_B$  are easily made larger since the resistance-divided node can be connected to the SENSE pin through which no feed-through current flows. However, be careful of error in the current flowing through the internal resistance ( $R_{SENSE}$ ) that will occur.

Although  $R_{SENSE}$  in the S-1002 Series is large (5 M $\Omega$  min.) to make the error small,  $R_A$  and  $R_B$  should be selected such that the error is within the allowable limits.

### 2.2 Selection of $R_A$ and $R_B$

In **Figure 25**, the relation between the external setting detection voltage ( $V_{DX}$ ) and the actual detection voltage ( $-V_{DET}$ ) is ideally calculated by the equation below.

$$V_{DX} = -V_{DET} \times \left(1 + \frac{R_A}{R_B}\right) \quad \cdots (1)$$

However, in reality there is an error in the current flowing through  $R_{SENSE}$ .

When considering this error, the relation between  $V_{DX}$  and  $-V_{DET}$  is calculated as follows.

$$\begin{aligned} V_{DX} &= -V_{DET} \times \left(1 + \frac{R_A}{R_B \parallel R_{SENSE}}\right) \\ &= -V_{DET} \times \left(1 + \frac{R_A}{\frac{R_B \times R_{SENSE}}{R_B + R_{SENSE}}}\right) \\ &= -V_{DET} \times \left(1 + \frac{R_A}{R_B}\right) + \frac{R_A}{R_{SENSE}} \times -V_{DET} \quad \cdots (2) \end{aligned}$$

By using equations (1) and (2), the error is calculated as  $-V_{DET} \times \frac{R_A}{R_{SENSE}}$ .

The error rate is calculated as follows by dividing the error by the right-hand side of equation (1).

$$\frac{R_A \times R_B}{R_{SENSE} \times (R_A + R_B)} \times 100 [\%] = \frac{R_A \parallel R_B}{R_{SENSE}} \times 100 [\%] \quad \cdots (3)$$

As seen in equation (3), the smaller the resistance values of  $R_A$  and  $R_B$  compared to  $R_{SENSE}$ , the smaller the error rate becomes.

Also, the relation between the external setting hysteresis width ( $V_{HX}$ ) and the hysteresis width ( $V_{HYS}$ ) is calculated by equation below. Error due to  $R_{SENSE}$  also occurs to the relation in a similar way to the detection voltage.

$$V_{HX} = V_{HYS} \times \left(1 + \frac{R_A}{R_B}\right) \quad \cdots (4)$$

**Figure 25** Detection Voltage External Setting Circuit

**Caution** If  $R_A$  and  $R_B$  are large, the SENSE pin input impedance becomes higher and may cause a malfunction due to noise. In this case, connect a capacitor between the SENSE pin and the VSS pin.

### 2.3 Power on sequence

Apply power in the order, the VDD pin then the SENSE pin.

As seen in **Figure 26**, when  $V_{\text{SENSE}} \geq +V_{\text{DET}}$ , the OUT pin output ( $V_{\text{OUT}}$ ) rises and the S-1002 Series becomes the release status (normal operation).

Figure 26

**Caution** If power is applied in the order the SENSE pin then the VDD pin, an erroneous release may occur even if  $V_{\text{SENSE}} < +V_{\text{DET}}$ .

### 2.4 Precautions when shorting between the VDD pin and the SENSE pin

#### 2.4.1 Input resistor

Do not connect the input resistor ( $R_A$ ) when shorting between the VDD pin and the SENSE pin.

A feed-through current flows through the VDD pin at the time of release. When connecting the circuit shown as **Figure 27**, the feed-through current of the VDD pin flowing through  $R_A$  will cause a drop in  $V_{\text{SENSE}}$  at the time of release.

At that time, oscillation may occur if  $V_{\text{SENSE}} \leq -V_{\text{DET}}$ .

Figure 27

#### 2.4.2 Parasitic resistance and parasitic capacitance

Due to the difference in parasitic resistance and parasitic capacitance of the VDD pin and the SENSE pin, power may be applied to the SENSE pin first.

Note that an erroneous release may occur if this happens (refer to "2.3 Power on sequence").

**Caution** In CMOS output product, make sure that the VDD pin input impedance does not become too high, regardless of the above. Since a feed-through current is large, a malfunction may occur if the VDD pin voltage changes greatly at the time of release.

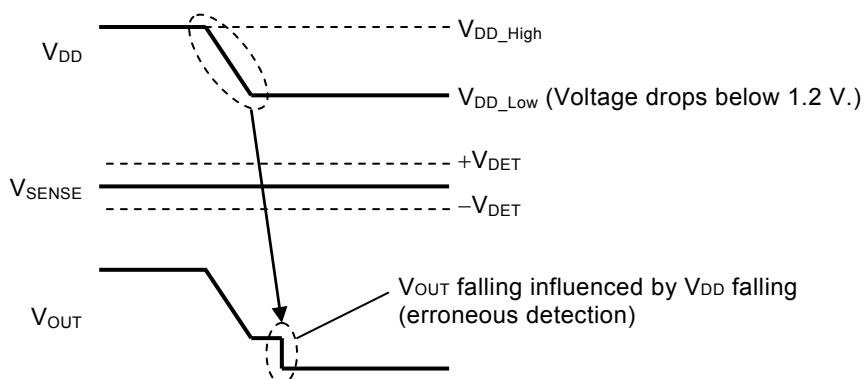

### 2.5 Malfunction when $V_{DD}$ falls

As seen in **Figure 28**, note that if the  $V_{DD}$  pin voltage ( $V_{DD}$ ) drops steeply below 1.2 V when  $-V_{DET} < V_{SENSE} < +V_{DET}$ , erroneous detection may occur.

When  $V_{DD\_Low} \geq 1.2$  V, erroneous detection does not occur.

When  $V_{DD\_Low} < 1.2$  V, the more the  $V_{DD}$  falling amplitude increases or the shorter the falling time becomes, the easier the erroneous detection.

Perform thorough evaluation in actual application.

**Figure 28**

The S-1002Cx50 example in **Figure 29** shows an example of erroneous detection boundary conditions.

**Figure 29**

### 3. Other characteristics

#### 3.1 Temperature characteristics of detection voltage

The shaded area in **Figure 31** shows the temperature characteristics of detection voltage in the operation temperature range.

\*1.  $-V_{DET25}$  is a detection voltage value at  $T_a = +25^{\circ}\text{C}$ .

**Figure 31 Temperature Characteristics of Detection Voltage (Example for  $-V_{DET} = 2.7\text{ V}$ )**

#### 3.2 Temperature characteristics of release voltage

The temperature change  $\frac{\Delta+V_{DET}}{\Delta T_a}$  of the release voltage is calculated by using the temperature change  $\frac{\Delta-V_{DET}}{\Delta T_a}$  of the detection voltage as follows:

$$\frac{\Delta+V_{DET}}{\Delta T_a} = \frac{+V_{DET}}{-V_{DET}} \times \frac{\Delta-V_{DET}}{\Delta T_a}$$

The temperature change of the release voltage and the detection voltage has the same sign consequently.

#### 3.3 Temperature characteristics of hysteresis voltage

The temperature change of the hysteresis voltage is expressed as  $\frac{\Delta+V_{DET}}{\Delta T_a} - \frac{\Delta-V_{DET}}{\Delta T_a}$  and is calculated as follows:

$$\frac{\Delta+V_{DET}}{\Delta T_a} - \frac{\Delta-V_{DET}}{\Delta T_a} = \frac{V_{HYS}}{-V_{DET}} \times \frac{\Delta-V_{DET}}{\Delta T_a}$$

## ■ Precautions

- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- In CMOS output product of the S-1002 Series, the feed-through current flows at the time of detection and release. If the VDD pin input impedance is high, malfunction may occur due to the voltage drop by the feed-through current when releasing.
- In CMOS output product, oscillation may occur if a pull-down resistor is connected and falling speed of the SENSE pin voltage ( $V_{\text{SENSE}}$ ) is slow near the detection voltage when the VDD pin and the SENSE pin are shorted.
- When designing for mass production using an application circuit described herein, the product deviation and temperature characteristics of the external parts should be taken into consideration. ABLIC Inc. shall not bear any responsibility for patent infringements related to products using the circuits described herein.
- ABLIC Inc. claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.

## ■ Application Circuit Examples

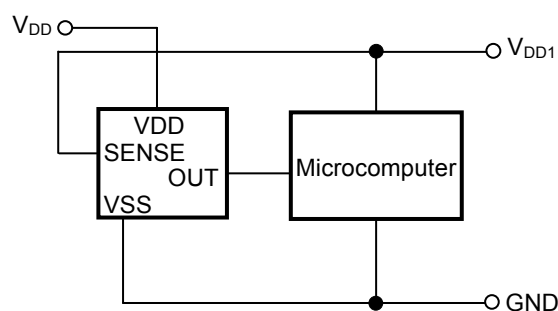

### 1. Microcomputer reset circuits

In microcomputers, when the power supply voltage is lower than the minimum operation voltage, an unspecified operation may be performed or the contents of the memory register may be lost. When power supply voltage returns to the normal level, the microcomputer needs to be initialized. Otherwise, the microcomputer may malfunction after that. Reset circuits to protect microcomputer in the event of current being momentarily switched off or lowered.

Using the S-1002 Series which has the low minimum operation voltage, the high-accuracy detection voltage and the hysteresis width, reset circuits can be easily constructed as seen in **Figure 35** and **Figure 36**.

**Figure 35** Example of Reset Circuit  
(Nch open-drain output product)

(CMOS output product)

**Caution** The above connection diagram and constant will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constant.

## 2. Change of detection voltage

If there is not a product with a specified detection voltage value in the S-1002 Series, the detection voltage can be changed by using a resistance divider or a diode, as seen in **Figure 37** to **Figure 40**.

In **Figure 37** and **Figure 38**, hysteresis width also changes.

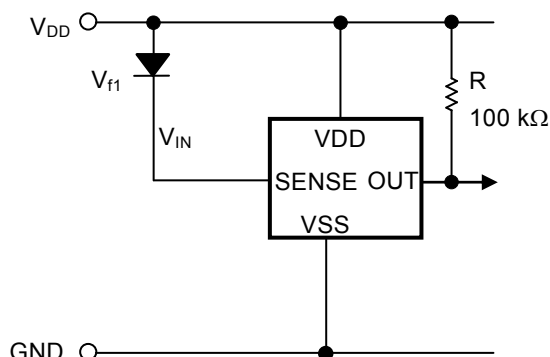

**Figure 37** Detection voltage change when using a resistance divider (Nch open-drain output product)

**Figure 38** Detection voltage change when using a resistance divider (CMOS output product)

**Remark** Detection voltage =  $\frac{R_A + R_B}{R_B} \cdot -V_{DET}$   
Hysteresis width =  $\frac{R_A + R_B}{R_B} \cdot V_{HYS}$

**Figure 39** Detection voltage change when using a diode (Nch open-drain output product)

**Figure 40** Detection voltage change when using a diode (CMOS output product)

**Remark** Detection voltage =  $V_{f1} + (-V_{DET})$

- Caution 1.** The above connection diagram and constant will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constant.
- 2.** Set the constants referring to "2. 1 Error when detection voltage is set externally" in "■ Operation".

## Disclaimers (Handling Precautions)

1. All the information described herein (product data, specifications, figures, tables, programs, algorithms and application circuit examples, etc.) is current as of publishing date of this document and is subject to change without notice.
2. The circuit examples and the usages described herein are for reference only, and do not guarantee the success of any specific mass-production design.  
ABLIC Inc. is not responsible for damages caused by the reasons other than the products described herein (hereinafter "the products") or infringement of third-party intellectual property right and any other right due to the use of the information described herein.
3. ABLIC Inc. is not responsible for damages caused by the incorrect information described herein.
4. Be careful to use the products within their specified ranges. Pay special attention to the absolute maximum ratings, operation voltage range and electrical characteristics, etc.  
ABLIC Inc. is not responsible for damages caused by failures and / or accidents, etc. that occur due to the use of the products outside their specified ranges.
5. When using the products, confirm their applications, and the laws and regulations of the region or country where they are used and verify suitability, safety and other factors for the intended use.
6. When exporting the products, comply with the Foreign Exchange and Foreign Trade Act and all other export-related laws, and follow the required procedures.
7. The products must not be used or provided (exported) for the purposes of the development of weapons of mass destruction or military use. ABLIC Inc. is not responsible for any provision (export) to those whose purpose is to develop, manufacture, use or store nuclear, biological or chemical weapons, missiles, or other military use.
8. The products are not designed to be used as part of any device or equipment that may affect the human body, human life, or assets (such as medical equipment, disaster prevention systems, security systems, combustion control systems, infrastructure control systems, vehicle equipment, traffic systems, in-vehicle equipment, aviation equipment, aerospace equipment, and nuclear-related equipment), excluding when specified for in-vehicle use or other uses. Do not apply the products to the above listed devices and equipments without prior written permission by ABLIC Inc. Especially, the products cannot be used for life support devices, devices implanted in the human body and devices that directly affect human life, etc.  
Prior consultation with our sales office is required when considering the above uses.  
ABLIC Inc. is not responsible for damages caused by unauthorized or unspecified use of our products.
9. Semiconductor products may fail or malfunction with some probability.  
The user of the products should therefore take responsibility to give thorough consideration to safety design including redundancy, fire spread prevention measures, and malfunction prevention to prevent accidents causing injury or death, fires and social damage, etc. that may ensue from the products' failure or malfunction.  
The entire system must be sufficiently evaluated and applied on customer's own responsibility.
10. The products are not designed to be radiation-proof. The necessary radiation measures should be taken in the product design by the customer depending on the intended use.
11. The products do not affect human health under normal use. However, they contain chemical substances and heavy metals and should therefore not be put in the mouth. The fracture surfaces of wafers and chips may be sharp. Be careful when handling these with the bare hands to prevent injuries, etc.
12. When disposing of the products, comply with the laws and ordinances of the country or region where they are used.
