

# M29W640DT M29W640DB

64 Mbit (8Mb x8 or 4Mb x16, Boot Block)  
3V Supply Flash Memory

## FEATURES SUMMARY

- **SUPPLY VOLTAGE**
  - $V_{CC} = 2.7V$  to  $3.6V$  for Program, Erase, Read
  - $V_{PP} = 12V$  for Fast Program (optional)
- **ACCESS TIME:** 90 ns
- **PROGRAMMING TIME**
  - 10  $\mu s$  per Byte/Word typical
  - Double Word Programming Option
- **135 MEMORY BLOCKS**
  - 1 Boot Block and 7 Parameter Blocks, 8 KBytes each (Top or Bottom Location)
  - 127 Main Blocks, 64 KBytes each
- **PROGRAM/ERASE CONTROLLER**
  - Embedded Byte/Word Program algorithms
- **ERASE SUSPEND and RESUME MODES**
  - Read and Program another Block during Erase Suspend
- **UNLOCK BYPASS PROGRAM COMMAND**
  - Faster Production/Batch Programming
- $V_{PP}/WP$  Pin for FAST PROGRAM and WRITE PROTECT
- **TEMPORARY BLOCK UNPROTECTION MODE**
- **COMMON FLASH INTERFACE**
  - 64-bit Security Code
- **EXTENDED MEMORY BLOCK**
  - Extra block used as security block or to store additional information
- **LOW POWER CONSUMPTION**
  - Standby and Automatic Standby
- **100,000 PROGRAM/ERASE CYCLES per BLOCK**
- **ELECTRONIC SIGNATURE**
  - Manufacturer Code: 0020h
  - Top Device Code M29W640DT: 22DEh
  - Bottom Device Code M29W640DB: 22DFh

## SUMMARY DESCRIPTION

The M29W640D is a 64 Mbit (8Mb x8 or 4Mb x16) non-volatile memory that can be read, erased and reprogrammed. These operations can be performed using a single low voltage (2.7 to 3.6V) supply. On power-up the memory defaults to its Read mode.

The memory is divided into blocks that can be erased independently so it is possible to preserve valid data while old data is erased. Blocks can be protected in units of 256 KByte (generally groups of four 64 KByte blocks), to prevent accidental Program or Erase commands from modifying the memory. Program and Erase commands are written to the Command Interface of the memory. An on-chip Program/Erase Controller simplifies the process of programming or erasing the memory by taking care of all of the special operations that are required to update the memory contents. The end of a program or erase operation can be detected and any error conditions identified. The command set required to control the memory is consistent with JEDEC standards.

The device features an asymmetrical blocked architecture. The device has an array of 135 blocks:

- 8 Parameters Blocks of 8 KBytes each (or 4 KWords each)
- 127 Main Blocks of 64 KBytes each (or 32 KWords each)

M29W640DT has the Parameter Blocks at the top of the memory address space while the M29W640DB locates the Parameter Blocks starting from the bottom.

The M29W640D has an extra block, the Extended Block, (of 32 KWords in x16 mode or of 64 KBytes in x8 mode) that can be accessed using a dedicated command. The Extended Block can be protected and so is useful for storing security information. However the protection is not reversible, once protected the protection cannot be undone.

Chip Enable, Output Enable and Write Enable signals control the bus operation of the memory. They allow simple connection to most microprocessors, often without additional logic.

The  $V_{PP}/\overline{WP}$  signal is used to enable faster programming of the device, enabling double word programming. If this signal is held at  $V_{SS}$ , the boot block, and its adjacent parameter block, are protected from program and erase operations.

The memory is delivered with all the bits erased (set to 1).

## SIGNAL DESCRIPTIONS

See [Figure 2., Logic Diagram](#), and [Table 1., Signal Names](#), for a brief overview of the signals connected to this device.

**Address Inputs (A0-A21).** The Address Inputs select the cells in the memory array to access during Bus Read operations. During Bus Write operations they control the commands sent to the Command Interface of the Program/Erase Controller.

**Data Inputs/Outputs (DQ0-DQ7).** The Data I/O outputs the data stored at the selected address during a Bus Read operation. During Bus Write operations they represent the commands sent to the Command Interface of the Program/Erase Controller.

**Data Inputs/Outputs (DQ8-DQ14).** The Data I/O outputs the data stored at the selected address during a Bus Read operation when BYTE is High,  $V_{IH}$ . When BYTE is Low,  $V_{IL}$ , these pins are not used and are high impedance. During Bus Write operations the Command Register does not use these bits. When reading the Status Register these bits should be ignored.

**Data Input/Output or Address Input (DQ15A-1).**

When  $\overline{BYTE}$  is High,  $V_{IH}$ , this pin behaves as a Data Input/Output pin (as DQ8-DQ14). When  $\overline{BYTE}$  is Low,  $V_{IL}$ , this pin behaves as an address pin; DQ15A-1 Low will select the LSB of the addressed Word, DQ15A-1 High will select the MSB. Throughout the text consider references to the Data Input/Output to include this pin when  $\overline{BYTE}$  is High and references to the Address Inputs to include this pin when  $\overline{BYTE}$  is Low except when stated explicitly otherwise.

**Chip Enable ( $\overline{E}$ ).** The Chip Enable,  $\overline{E}$ , activates the memory, allowing Bus Read and Bus Write operations to be performed. When Chip Enable is High,  $V_{IH}$ , all other pins are ignored.

**Output Enable ( $\overline{G}$ ).** The Output Enable,  $\overline{G}$ , controls the Bus Read operation of the memory.

**Write Enable ( $\overline{W}$ ).** The Write Enable,  $\overline{W}$ , controls the Bus Write operation of the memory's Command Interface.

**$V_{PP}$ /Write Protect ( $\overline{V_{PP}/WP}$ ).** The  $V_{PP}$ /Write Protect pin provides two functions. The  $V_{PP}$  function allows the memory to use an external high voltage power supply to reduce the time required for Unlock Bypass Program operations. The Write Protect function provides a hardware method of protecting the two outermost boot blocks. The  $V_{PP}$ /Write Protect pin must not be left floating or unconnected.

When  $V_{PP}$ /Write Protect is Low,  $V_{IL}$ , the memory protects the two outermost boot blocks; Program

and Erase operations in this block are ignored while  $V_{PP}$ /Write Protect is Low.

When  $V_{PP}$ /Write Protect is High,  $V_{IH}$ , the memory reverts to the previous protection status of the two outermost boot blocks. Program and Erase operations can now modify the data in the two outermost boot blocks unless the block is protected using Block Protection.

When  $V_{PP}$ /Write Protect is raised to  $V_{PP}$  the memory automatically enters the Unlock Bypass mode. When  $V_{PP}$ /Write Protect returns to  $V_{IH}$  or  $V_{IL}$  normal operation resumes. During Unlock Bypass Program operations the memory draws  $I_{PP}$  from the pin to supply the programming circuits. See the description of the Unlock Bypass command in the Command Interface section. The transitions from  $V_{IH}$  to  $V_{PP}$  and from  $V_{PP}$  to  $V_{IH}$  must be slower than  $t_{VHVPP}$ , see [Figure 13.](#)

Never raise  $V_{PP}$ /Write Protect to  $V_{PP}$  from any mode except Read mode, otherwise the memory may be left in an indeterminate state.

A 0.1 $\mu$ F capacitor should be connected between the  $V_{PP}$ /Write Protect pin and the  $V_{SS}$  Ground pin to decouple the current surges from the power supply. The PCB track widths must be sufficient to carry the currents required during Unlock Bypass Program,  $I_{PP}$ .

**Reset/Block Temporary Unprotect ( $\overline{RP}$ ).** The Reset/Block Temporary Unprotect pin can be used to apply a Hardware Reset to the memory or to temporarily unprotect all Blocks that have been protected.

Note that if  $V_{PP}/\overline{WP}$  is at  $V_{IL}$ , then the two outermost boot blocks will remain protected even if  $\overline{RP}$  is at  $V_{ID}$ .

A Hardware Reset is achieved by holding Reset/Block Temporary Unprotect Low,  $V_{IL}$ , for at least  $t_{PLPX}$ . After Reset/Block Temporary Unprotect goes High,  $V_{IH}$ , the memory will be ready for Bus Read and Bus Write operations after  $t_{PHEL}$  or  $t_{RHEL}$ , whichever occurs last. See the Ready/Busy Output section, [Table 15.](#) and [Figure 12., Reset/Block Temporary Unprotect AC Waveforms](#), for more details.

Holding  $\overline{RP}$  at  $V_{ID}$  will temporarily unprotect the protected Blocks in the memory. Program and Erase operations on all blocks will be possible. The transition from  $V_{IH}$  to  $V_{ID}$  must be slower than  $t_{PHPHH}$ .

**Ready/Busy Output ( $\overline{RB}$ ).** The Ready/Busy pin is an open-drain output that can be used to identify when the device is performing a Program or Erase operation. During Program or Erase operations Ready/Busy is Low,  $V_{OL}$ . Ready/Busy is high-im-

pedance during Read mode, Auto Select mode and Erase Suspend mode.

After a Hardware Reset, Bus Read and Bus Write operations cannot begin until Ready/Busy becomes high-impedance. See [Table 15](#), and [Figure 12](#), [Reset/Block Temporary Unprotect AC Waveforms](#), for more details.

The use of an open-drain output allows the Ready/Busy pins from several memories to be connected to a single pull-up resistor. A Low will then indicate that one, or more, of the memories is busy.

**Byte/Word Organization Select (BYTE).** The Byte/Word Organization Select pin is used to switch between the x8 and x16 Bus modes of the memory. When Byte/Word Organization Select is Low,  $V_{IL}$ , the memory is in x8 mode, when it is High,  $V_{IH}$ , the memory is in x16 mode.

**$V_{CC}$  Supply Voltage (2.7V to 3.6V).**  $V_{CC}$  provides the power supply for all operations (Read, Program and Erase).

The Command Interface is disabled when the  $V_{CC}$  Supply Voltage is less than the Lockout Voltage,  $V_{LKO}$ . This prevents Bus Write operations from accidentally damaging the data during power up, power down and power surges. If the Program/Erase Controller is programming or erasing during this time then the operation aborts and the memory contents being altered will be invalid.

A 0.1 $\mu$ F capacitor should be connected between the  $V_{CC}$  Supply Voltage pin and the  $V_{SS}$  Ground pin to decouple the current surges from the power supply. The PCB track widths must be sufficient to carry the currents required during Program and Erase operations,  $I_{CC3}$ .

**$V_{SS}$  Ground.**  $V_{SS}$  is the reference for all voltage measurements. The device features two  $V_{SS}$  pins which must be both connected to the system ground.

## BUS OPERATIONS

There are five standard bus operations that control the device. These are Bus Read, Bus Write, Output Disable, Standby and Automatic Standby. See [Table 2.](#) and [Table 3., Bus Operations, BYTE =  \$V\_{IH}\$](#) , for a summary. Typically glitches of less than 5ns on Chip Enable or Write Enable are ignored by the memory and do not affect bus operations.

**Bus Read.** Bus Read operations read from the memory cells, or specific registers in the Command Interface. A valid Bus Read operation involves setting the desired address on the Address Inputs, applying a Low signal,  $V_{IL}$ , to Chip Enable and Output Enable and keeping Write Enable High,  $V_{IH}$ . The Data Inputs/Outputs will output the value, see [Figure 9., Read Mode AC Waveforms](#), and [Table 12., Read AC Characteristics](#), for details of when the output becomes valid.

**Bus Write.** Bus Write operations write to the Command Interface. A valid Bus Write operation begins by setting the desired address on the Address Inputs. The Address Inputs are latched by the Command Interface on the falling edge of Chip Enable or Write Enable, whichever occurs last. The Data Inputs/Outputs are latched by the Command Interface on the rising edge of Chip Enable or Write Enable, whichever occurs first. Output Enable must remain High,  $V_{IH}$ , during the whole Bus Write operation. See [Figure 10.](#) and [Figure 11., Write AC Waveforms, Chip Enable Controlled](#), and [Table 13.](#) and [Table 14., Write AC Characteristics, Chip Enable Controlled](#), for details of the timing requirements.

**Output Disable.** The Data Inputs/Outputs are in the high impedance state when Output Enable is High,  $V_{IH}$ .

**Standby.** When Chip Enable is High,  $V_{IH}$ , the memory enters Standby mode and the Data Inputs/Outputs pins are placed in the high-impedance state. To reduce the Supply Current to the Standby Supply Current,  $I_{CC2}$ , Chip Enable should be held within  $V_{CC} \pm 0.2V$ . For the Standby current level see [Table 11., DC Characteristics](#).

During program or erase operations the memory will continue to use the Program/Erase Supply Current,  $I_{CC3}$ , for Program or Erase operations until the operation completes.

**Automatic Standby.** If CMOS levels ( $V_{CC} \pm 0.2V$ ) are used to drive the bus and the bus is inactive for 300ns or more the memory enters Automatic Standby where the internal Supply Current is reduced to the Standby Supply Current,  $I_{CC2}$ . The Data Inputs/Outputs will still output data if a Bus Read operation is in progress.

### Special Bus Operations

Additional bus operations can be performed to read the Electronic Signature and also to apply and remove Block Protection. These bus operations are intended for use by programming equipment and are not usually used in applications. They require  $V_{ID}$  to be applied to some pins.

**Electronic Signature.** The memory has two codes, the manufacturer code and the device code, that can be read to identify the memory. These codes can be read by applying the signals listed in [Table 2.](#) and [Table 3., Bus Operations, BYTE =  \$V\_{IH}\$](#) .

**Block Protect and Chip Unprotect.** Groups of blocks can be protected against accidental Program or Erase. The Protection Groups are shown in [APPENDIX A., Table 19.](#) and [Table 20., Bottom Boot Block Addresses, M29W640DB](#). The whole chip can be unprotected to allow the data inside the blocks to be changed.

The  $V_{PP}$ /Write Protect pin can be used to protect the two outermost boot blocks. When  $V_{PP}$ /Write Protect is at  $V_{IL}$  the two outermost boot blocks are protected and remain protected regardless of the Block Protection Status or the Reset/Block Temporary Unprotect pin status.

Block Protect and Chip Unprotect operations are described in [APPENDIX D.](#)

## COMMAND INTERFACE

All Bus Write operations to the memory are interpreted by the Command Interface. Commands consist of one or more sequential Bus Write operations. Failure to observe a valid sequence of Bus Write operations will result in the memory returning to Read mode. The long command sequences are imposed to maximize data security.

The address used for the commands changes depending on whether the memory is in 16-bit or 8-bit mode. See either [Table 4.](#), or [Table 5.](#), depending on the configuration that is being used, for a summary of the commands.

### Read/Reset Command.

The Read/Reset command returns the memory to its Read mode. It also resets the errors in the Status Register. Either one or three Bus Write operations can be used to issue the Read/Reset command.

The Read/Reset command can be issued, between Bus Write cycles before the start of a program or erase operation, to return the device to read mode. If the Read/Reset command is issued during the timeout of a Block Erase operation then the memory will take up to 10 $\mu$ s to abort. During the abort period no valid data can be read from the memory. The Read/Reset command will not abort an Erase operation when issued while in Erase Suspend.

### Auto Select Command.

The Auto Select command is used to read the Manufacturer Code, the Device Code, the Block Protection Status and the Extended Memory Block Verify Code. Three consecutive Bus Write operations are required to issue the Auto Select command. Once the Auto Select command is issued the memory remains in Auto Select mode until a Read/Reset command is issued. Read CFI Query and Read/Reset commands are accepted in Auto Select mode, all other commands are ignored.

In Auto Select mode the Manufacturer Code can be read using a Bus Read operation with A0 = V<sub>IL</sub> and A1 = V<sub>IL</sub>. The other address bits may be set to either V<sub>IL</sub> or V<sub>IH</sub>. The Manufacturer Code for ST-Microelectronics is 0020h.

The Device Code can be read using a Bus Read operation with A0 = V<sub>IH</sub> and A1 = V<sub>IL</sub>. The other address bits may be set to either V<sub>IL</sub> or V<sub>IH</sub>. The Device Code for the M29W640DT is 22DEh and for the M29W640DB is 22DFh.

The Block Protection Status of each block can be read using a Bus Read operation with A0 = V<sub>IL</sub>, A1 = V<sub>IH</sub>, and A12-A21 specifying the address of the block. The other address bits may be set to either V<sub>IL</sub> or V<sub>IH</sub>. If the addressed block is protected

then 01h is output on Data Inputs/Outputs DQ0-DQ7, otherwise 00h is output.

### Read CFI Query Command

The Read CFI Query Command is used to read data from the Common Flash Interface (CFI) Memory Area. This command is valid when the device is in the Read Array mode, or when the device is in Autoselected mode.

One Bus Write cycle is required to issue the Read CFI Query Command. Once the command is issued subsequent Bus Read operations read from the Common Flash Interface Memory Area.

The Read/Reset command must be issued to return the device to the previous mode (the Read Array mode or Autoselected mode). A second Read/Reset command would be needed if the device is to be put in the Read Array mode from Autoselected mode.

See [APPENDIX B.](#), [Table 21.](#) to [Table 26.](#) for details on the information contained in the Common Flash Interface (CFI) memory area.

### Program Command.

The Program command can be used to program a value to one address in the memory array at a time. The command requires four Bus Write operations, the final write operation latches the address and data, and starts the Program/Erase Controller.

If the address falls in a protected block then the Program command is ignored, the data remains unchanged. The Status Register is never read and no error condition is given.

During the program operation the memory will ignore all commands. It is not possible to issue any command to abort or pause the operation. Typical program times are given in [Table 6.](#) Bus Read operations during the program operation will output the Status Register on the Data Inputs/Outputs. See the section on the Status Register for more details.

After the program operation has completed the memory will return to the Read mode, unless an error has occurred. When an error occurs the memory will continue to output the Status Register. A Read/Reset command must be issued to reset the error condition and return to Read mode.

Note that the Program command cannot change a bit set at '0' back to '1'. One of the Erase Commands must be used to set all the bits in a block or in the whole memory from '0' to '1'.

### Fast Program Commands

There are two Fast Program commands available to improve the programming throughput, by writing several adjacent words or bytes in parallel. The

Quadruple Byte Program command is available for x8 operations, while the Double Word Program command is available for x16 operations.

**Quadruple Byte Program Command.** The Quadruple Byte Program command is used to write a page of four adjacent Bytes in parallel. The four bytes must differ only for addresses A0, DQ15A-1. Five bus write cycles are necessary to issue the Quadruple Byte Program command.

- The first bus cycle sets up the Quadruple Byte Program Command.
- The second bus cycle latches the Address and the Data of the first byte to be written.
- The third bus cycle latches the Address and the Data of the second byte to be written.
- The fourth bus cycle latches the Address and the Data of the third byte to be written.
- The fifth bus cycle latches the Address and the Data of the fourth byte to be written and starts the Program/Erase Controller.

#### **Double Word Program Command.**

The Double Word Program command is used to write a page of two adjacent words in parallel. The two words must differ only for the address A0. Programming should not be attempted when  $V_{PP}$  is not at  $V_{PPH}$ .

Three bus write cycles are necessary to issue the Double Word Program command.

- The first bus cycle sets up the Double Word Program Command.
- The second bus cycle latches the Address and the Data of the first word to be written.
- The third bus cycle latches the Address and the Data of the second word to be written and starts the Program/Erase Controller.

After the program operation has completed the memory will return to the Read mode, unless an error has occurred. When an error occurs Bus Read operations will continue to output the Status Register. A Read/Reset command must be issued to reset the error condition and return to Read mode.

Note that the Fast Program commands cannot change a bit set at '0' back to '1'. One of the Erase Commands must be used to set all the bits in a block or in the whole memory from '0' to '1'.

Typical Program times are given in [Table 6., Program, Erase Times and Program, Erase Endurance Cycles](#).

#### **Unlock Bypass Command.**

The Unlock Bypass command is used in conjunction with the Unlock Bypass Program command to program the memory faster than with the standard

program commands. When the cycle time to the device is long, considerable time saving can be made by using these commands. Three Bus Write operations are required to issue the Unlock Bypass command.

Once the Unlock Bypass command has been issued the memory will only accept the Unlock Bypass Program command and the Unlock Bypass Reset command. The memory can be read as if in Read mode.

When  $V_{PP}$  is applied to the  $V_{PP}$ /Write Protect pin the memory automatically enters the Unlock Bypass mode and the Unlock Bypass Program command can be issued immediately.

#### **Unlock Bypass Program Command.**

The Unlock Bypass command is used in conjunction with the Unlock Bypass Program command to program the memory. When the cycle time to the device is long, considerable time saving can be made by using these commands. Three Bus Write operations are required to issue the Unlock Bypass command.

Once the Unlock Bypass command has been issued the memory will only accept the Unlock Bypass Program command and the Unlock Bypass Reset command. The memory can be read as if in Read mode.

The memory offers accelerated program operations through the  $V_{PP}$ /Write Protect pin. When the system asserts  $V_{PP}$  on the  $V_{PP}$ /Write Protect pin, the memory automatically enters the Unlock Bypass mode. The system may then write the two-cycle Unlock Bypass program command sequence. The memory uses the higher voltage on the  $V_{PP}$ /Write Protect pin, to accelerate the Unlock Bypass Program operation.

Never raise  $V_{PP}$ /Write Protect to  $V_{PP}$  from any mode except Read mode, otherwise the memory may be left in an indeterminate state.

#### **Unlock Bypass Reset Command.**

The Unlock Bypass Reset command can be used to return to Read/Reset mode from Unlock Bypass Mode. Two Bus Write operations are required to issue the Unlock Bypass Reset command. Read/Reset command does not exit from Unlock Bypass Mode.

#### **Chip Erase Command.**

The Chip Erase command can be used to erase the entire chip. Six Bus Write operations are required to issue the Chip Erase Command and start the Program/Erase Controller.

If any blocks are protected then these are ignored and all the other blocks are erased. If all of the blocks are protected the Chip Erase operation appears to start but will terminate within about 100 $\mu$ s,

leaving the data unchanged. No error condition is given when protected blocks are ignored.

During the erase operation the memory will ignore all commands, including the Erase Suspend command. It is not possible to issue any command to abort the operation. Typical chip erase times are given in [Table 6](#). All Bus Read operations during the Chip Erase operation will output the Status Register on the Data Inputs/Outputs. See the section on the Status Register for more details.

After the Chip Erase operation has completed the memory will return to the Read Mode, unless an error has occurred. When an error occurs the memory will continue to output the Status Register. A Read/Reset command must be issued to reset the error condition and return to Read Mode.

The Chip Erase Command sets all of the bits in unprotected blocks of the memory to '1'. All previous data is lost.

#### **Block Erase Command.**

The Block Erase command can be used to erase a list of one or more blocks. Six Bus Write operations are required to select the first block in the list. Each additional block in the list can be selected by repeating the sixth Bus Write operation using the address of the additional block. The Block Erase operation starts the Program/Erase Controller about 50 $\mu$ s after the last Bus Write operation. Once the Program/Erase Controller starts it is not possible to select any more blocks. Each additional block must therefore be selected within 50 $\mu$ s of the last block. The 50 $\mu$ s timer restarts when an additional block is selected. The Status Register can be read after the sixth Bus Write operation. See the Status Register section for details on how to identify if the Program/Erase Controller has started the Block Erase operation.

If any selected blocks are protected then these are ignored and all the other selected blocks are erased. If all of the selected blocks are protected the Block Erase operation appears to start but will terminate within about 100 $\mu$ s, leaving the data unchanged. No error condition is given when protected blocks are ignored.

During the Block Erase operation the memory will ignore all commands except the Erase Suspend command. Typical block erase times are given in [Table 6](#). All Bus Read operations during the Block Erase operation will output the Status Register on the Data Inputs/Outputs. See the section on the Status Register for more details.

After the Block Erase operation has completed the memory will return to the Read Mode, unless an error has occurred. When an error occurs the memory will continue to output the Status Register. A Read/Reset command must be issued to reset the error condition and return to Read mode.

The Block Erase Command sets all of the bits in the unprotected selected blocks to '1'. All previous data in the selected blocks is lost.

#### **Erase Suspend Command.**

The Erase Suspend Command may be used to temporarily suspend a Block Erase operation and return the memory to Read mode. The command requires one Bus Write operation.

The Program/Erase Controller will suspend within the Erase Suspend Latency time of the Erase Suspend Command being issued. Once the Program/Erase Controller has stopped the memory will be set to Read mode and the Erase will be suspended. If the Erase Suspend command is issued during the period when the memory is waiting for an additional block (before the Program/Erase Controller starts) then the Erase is suspended immediately and will start immediately when the Erase Resume Command is issued. It is not possible to select any further blocks to erase after the Erase Resume.

During Erase Suspend it is possible to Read and Program cells in blocks that are not being erased; both Read and Program operations behave as normal on these blocks. If any attempt is made to program in a protected block or in the suspended block then the Program command is ignored and the data remains unchanged. The Status Register is not read and no error condition is given. Reading from blocks that are being erased will output the Status Register.

It is also possible to issue the Auto Select, Read CFI Query and Unlock Bypass commands during an Erase Suspend. The Read/Reset command must be issued to return the device to Read Array mode before the Resume command will be accepted.

#### **Erase Resume Command.**

The Erase Resume command must be used to restart the Program/Erase Controller after an Erase Suspend. The device must be in Read Array mode before the Resume command will be accepted. An erase can be suspended and resumed more than once.

#### **Enter Extended Block Command**

The device has an extra 64 KByte block (Extended Block) that can only be accessed using the Enter Extended Block command. Three Bus write cycles are required to issue the Extended Block command. Once the command has been issued the device enters Extended Block mode where all Bus Read or Write operations to the Boot Block addresses access the Extended Block. The Extended Block (with the same address as the Boot Blocks) cannot be erased, and can be treated as one-time programmable (OTP) memory. In Ex-

tended Block mode the Boot Blocks are not accessible.

To exit from the Extended Block mode the Exit Extended Block command must be issued.

The Extended Block can be protected, however once protected the protection cannot be undone.

#### Exit Extended Block Command

The Exit Extended Block command is used to exit from the Extended Block mode and return the de-

vice to Read mode. Four Bus Write operations are required to issue the command.

#### Block Protect and Chip Unprotect Commands

Groups of blocks can be protected against accidental Program or Erase. The Protection Groups are shown in [APPENDIX A., Table 19.](#) and [Table 20., Bottom Boot Block Addresses, M29W640DB.](#) The whole chip can be unprotected to allow the data inside the blocks to be changed.

Block Protect and Chip Unprotect operations are described in [APPENDIX D.](#)

**Table 4. Commands, 16-bit mode,  $\overline{\text{BYTE}} = V_{IH}$**

| Command               | Length | Bus Write Operations |      |      |      |      |      |      |      |      |      |      |      |
|-----------------------|--------|----------------------|------|------|------|------|------|------|------|------|------|------|------|
|                       |        | 1st                  |      | 2nd  |      | 3rd  |      | 4th  |      | 5th  |      | 6th  |      |
|                       |        | Addr                 | Data | Addr | Data | Addr | Data | Addr | Data | Addr | Data | Addr | Data |
| Read/Reset            | 1      | X                    | F0   |      |      |      |      |      |      |      |      |      |      |
|                       | 3      | 555                  | AA   | 2AA  | 55   | X    | F0   |      |      |      |      |      |      |

| Exit Extended Block    | 4      | AAA                  | AA   | 555 | 55   | AAA | 90   | X   | 00   |     |      |     |      |

Note: X Don't Care, PA Program Address, PD Program Data, BA Any address in the Block. All values in the table are in hexadecimal.

The Command Interface only uses A-1, A0-A10 and DQ0-DQ7 to verify the commands; A11-A20, DQ8-DQ14 and DQ15 are Don't Care. DQ15A-1 is A-1 when BYTE is V<sub>IL</sub> or DQ15 when BYTE is V<sub>IH</sub>.

**Table 6. Program, Erase Times and Program, Erase Endurance Cycles**

| Parameter                                    | Min     | Typ <sup>(1, 2)</sup> | Max <sup>(2)</sup> | Unit   |
|----------------------------------------------|---------|-----------------------|--------------------|--------|
| Chip Erase                                   |         | 80                    | 400 <sup>(3)</sup> | s      |
| Block Erase (64 KBytes)                      |         | 0.8                   | 6 <sup>(4)</sup>   | s      |
| Erase Suspend Latency Time                   |         |                       | 50 <sup>(4)</sup>  | μs     |
| Program (Byte or Word)                       |         | 10                    | 200 <sup>(3)</sup> | μs     |
| Double Word Program (Byte or Word)           |         | 10                    | 200 <sup>(3)</sup> | μs     |
| Chip Program (Byte by Byte)                  |         | 80                    | 400 <sup>(3)</sup> | s      |
| Chip Program (Word by Word)                  |         | 40                    | 200 <sup>(3)</sup> | s      |
| Chip Program (Quadruple Byte or Double Word) |         | 20                    | 100 <sup>(3)</sup> | s      |
| Program/Erase Cycles (per Block)             | 100,000 |                       |                    | cycles |
| Data Retention                               | 20      |                       |                    | years  |

Note: 1. Typical values measured at room temperature and nominal voltages.

2. Sampled, but not 100% tested.

3. Maximum value measured at worst case conditions for both temperature and V<sub>CC</sub> after 100,00 program/erase cycles.

4. Maximum value measured at worst case conditions for both temperature and V<sub>CC</sub>.

## STATUS REGISTER

Bus Read operations from any address always read the Status Register during Program and Erase operations. It is also read during Erase Suspend when an address within a block being erased is accessed.

The bits in the Status Register are summarized in [Table 7., Status Register Bits](#).

**Data Polling Bit (DQ7).** The Data Polling Bit can be used to identify whether the Program/Erase Controller has successfully completed its operation or if it has responded to an Erase Suspend. The Data Polling Bit is output on DQ7 when the Status Register is read.

During Program operations the Data Polling Bit outputs the complement of the bit being programmed to DQ7. After successful completion of the Program operation the memory returns to Read mode and Bus Read operations from the address just programmed output DQ7, not its complement.

During Erase operations the Data Polling Bit outputs '0', the complement of the erased state of DQ7. After successful completion of the Erase operation the memory returns to Read Mode.

In Erase Suspend mode the Data Polling Bit will output a '1' during a Bus Read operation within a block being erased. The Data Polling Bit will change from a '0' to a '1' when the Program/Erase Controller has suspended the Erase operation.

[Figure 5., Data Polling Flowchart](#), gives an example of how to use the Data Polling Bit. A Valid Address is the address being programmed or an address within the block being erased.

**Toggle Bit (DQ6).** The Toggle Bit can be used to identify whether the Program/Erase Controller has successfully completed its operation or if it has responded to an Erase Suspend. The Toggle Bit is output on DQ6 when the Status Register is read.

During Program and Erase operations the Toggle Bit changes from '0' to '1' to '0', etc., with successive Bus Read operations at any address. After successful completion of the operation the memory returns to Read mode.

During Erase Suspend mode the Toggle Bit will output when addressing a cell within a block being erased. The Toggle Bit will stop toggling when the Program/Erase Controller has suspended the Erase operation.

[Figure 6., Data Toggle Flowchart](#), gives an example of how to use the Data Toggle Bit.

**Error Bit (DQ5).** The Error Bit can be used to identify errors detected by the Program/Erase Controller. The Error Bit is set to '1' when a Program, Block Erase or Chip Erase operation fails to write the correct data to the memory. If the Error Bit is set a Read/Reset command must be issued before other commands are issued. The Error bit is output on DQ5 when the Status Register is read.

Note that the Program command cannot change a bit set to '0' back to '1' and attempting to do so will set DQ5 to '1'. A Bus Read operation to that address will show the bit is still '0'. One of the Erase commands must be used to set all the bits in a block or in the whole memory from '0' to '1'.

**Erase Timer Bit (DQ3).** The Erase Timer Bit can be used to identify the start of Program/Erase Controller operation during a Block Erase command. Once the Program/Erase Controller starts erasing the Erase Timer Bit is set to '1'. Before the Program/Erase Controller starts the Erase Timer Bit is set to '0' and additional blocks to be erased may be written to the Command Interface. The Erase Timer Bit is output on DQ3 when the Status Register is read.

**Alternative Toggle Bit (DQ2).** The Alternative Toggle Bit can be used to monitor the Program/Erase controller during Erase operations. The Alternative Toggle Bit is output on DQ2 when the Status Register is read.

During Chip Erase and Block Erase operations the Toggle Bit changes from '0' to '1' to '0', etc., with successive Bus Read operations from addresses within the blocks being erased. A protected block is treated the same as a block not being erased. Once the operation completes the memory returns to Read mode.

During Erase Suspend the Alternative Toggle Bit changes from '0' to '1' to '0', etc. with successive Bus Read operations from addresses within the blocks being erased. Bus Read operations to addresses within blocks not being erased will output the memory cell data as if in Read mode.

After an Erase operation that causes the Error Bit to be set the Alternative Toggle Bit can be used to identify which block or blocks have caused the error. The Alternative Toggle Bit changes from '0' to '1' to '0', etc. with successive Bus Read Operations from addresses within blocks that have not erased correctly. The Alternative Toggle Bit does not change if the addressed block has erased correctly.

Table 7. Status Register Bits

| Operation                    | Address              | DQ7                 | DQ6       | DQ5 | DQ3 | DQ2       | R $\overline{B}$ |
|------------------------------|----------------------|---------------------|-----------|-----|-----|-----------|------------------|
| Program                      | Any Address          | $\overline{DQ7}$    | Toggle    | 0   | –   | –         | 0                |
| Program During Erase Suspend | Any Address          | $\overline{DQ7}$    | Toggle    | 0   | –   | –         | 0                |
| Program Error                | Any Address          | $\overline{DQ7}$    | Toggle    | 1   | –   | –         | Hi-Z             |
| Chip Erase                   | Any Address          | 0                   | Toggle    | 0   | 1   | Toggle    | Hi-Z             |
| Block Erase before timeout   | Erasing Block        | 0                   | Toggle    | 0   | 0   | Toggle    | 0                |
|                              | Non-Erasing Block    | 0                   | Toggle    | 0   | 0   | No Toggle | 0                |
| Block Erase                  | Erasing Block        | 0                   | Toggle    | 0   | 1   | Toggle    | Hi-Z             |
|                              | Non-Erasing Block    | 0                   | Toggle    | 0   | 1   | No Toggle | 0                |
| Erase Suspend                | Erasing Block        | 1                   | No Toggle | 0   | –   | Toggle    | Hi-Z             |
|                              | Non-Erasing Block    | Data read as normal |           |     |     |           | Hi-Z             |
| Erase Error                  | Good Block Address   | 0                   | Toggle    | 1   | 1   | No Toggle | 0                |
|                              | Faulty Block Address | 0                   | Toggle    | 1   | 1   | Toggle    | 0                |

Note: Unspecified data bits should be ignored.

## MAXIMUM RATING

Stressing the device above the rating listed in the Absolute Maximum Ratings table may cause permanent damage to the device. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. These are stress ratings only and operation of the device at

these or any other conditions above those indicated in the Operating sections of this specification is not implied. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 8. Absolute Maximum Ratings**

| Symbol                         | Parameter                                        | Min  | Max                  | Unit |
|--------------------------------|--------------------------------------------------|------|----------------------|------|
| T <sub>BIAS</sub>              | Temperature Under Bias                           | –50  | 125                  | °C   |
| T <sub>STG</sub>               | Storage Temperature                              | –65  | 150                  | °C   |
| T <sub>LEAD</sub>              | Lead Temperature during Soldering <sup>(1)</sup> |      | 260 <sup>(2)</sup>   | °C   |
| V <sub>IO</sub>                | Input or Output Voltage <sup>(3,4)</sup>         | –0.6 | V <sub>CC</sub> +0.6 | V    |
| V <sub>CC</sub>                | Supply Voltage                                   | –0.6 | 4                    | V    |
| V <sub>ID</sub>                | Identification Voltage                           | –0.6 | 13.5                 | V    |
| V <sub>PP</sub> <sup>(5)</sup> | Program Voltage                                  | –0.6 | 13.5                 | V    |

Note: 1. Compliant with the ECOPACK® 7191395 specification for Lead-free soldering processes.  
 2. Not exceeding 250°C for more than 30s, and peaking at 260°C.  
 3. Minimum voltage may undershoot to –2V during transition and for less than 20ns during transitions.  
 4. Maximum voltage may overshoot to V<sub>CC</sub> +2V during transition and for less than 20ns during transitions.  
 5. V<sub>PP</sub> must not remain at 12V for more than a total of 80hrs.

DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC Characteristic tables that follow are derived from tests performed under the Measure-

ment Conditions summarized in the relevant tables. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

Table 9. Operating and AC Measurement Conditions

| Parameter                             | M29W640D             |     | Unit |
|---------------------------------------|----------------------|-----|------|
|                                       | Min                  | Max |      |
| V <sub>CC</sub> Supply Voltage        | 2.7                  | 3.6 | V    |
| Ambient Operating Temperature         | −40                  | 85  | °C   |
| Load Capacitance (C <sub>L</sub> )    | 30                   |     | pF   |
| Input Rise and Fall Times             | 10                   |     | ns   |

Note: 1. Used as the Extended Block Addresses in Extended Block mode.

## APPENDIX B. COMMON FLASH INTERFACE (CFI)

The Common Flash Interface is a JEDEC approved, standardized data structure that can be read from the Flash memory device. It allows a system software to query the device to determine various electrical and timing parameters, density information and functions supported by the memory. The system can interface easily with the device, enabling the software to upgrade itself when necessary.

When the CFI Query Command is issued the device enters CFI Query mode and the data structure is read from the memory. [Table 21.](#) to [Table 26.](#) show the addresses used to retrieve the data.

The CFI data structure also contains a security area where a 64 bit unique security number is written (see [Table 26.](#), [Security Code Area](#)). This area can be accessed only in Read mode by the final user. It is impossible to change the security number after it has been written by ST.

**Table 21. Query Structure Overview**

| Address |     | Sub-section Name                                | Description                                                         |
|---------|-----|-------------------------------------------------|---------------------------------------------------------------------|
| x16     | x8  |                                                 |                                                                     |
| 10h     | 20h | CFI Query Identification String                 | Command set ID and algorithm data offset                            |
| 1Bh     | 36h | System Interface Information                    | Device timing & voltage information                                 |
| 27h     | 4Eh | Device Geometry Definition                      | Flash device layout                                                 |
| 40h     | 80h | Primary Algorithm-specific Extended Query table | Additional information specific to the Primary Algorithm (optional) |
| 61h     | C2h | Security Code Area                              | 64 bit unique device number                                         |

Note: Query data are always presented on the lowest order data outputs.

**Table 22. CFI Query Identification String**

| Address |     | Data  | Description                                                                                              | Value          |
|---------|-----|-------|----------------------------------------------------------------------------------------------------------|----------------|

## APPENDIX C. EXTENDED MEMORY BLOCK

The M29W640D has an extra block, the Extended Block, that can be accessed using a dedicated command.

This Extended Block is 32 KWords in x16 mode and 64 KBytes in x8 mode. It is used as a security block (to provide a permanent security identification number) or to store additional information.

The Extended Block is either Factory Locked or Customer Lockable, its status is indicated by bit DQ7. This bit is permanently set to either '1' or '0' at the factory and cannot be changed. When set to '1', it indicates that the device is factory locked and the Extended Block is protected. When set to '0', it indicates that the device is customer lockable and the Extended Block is unprotected. Bit DQ7 being permanently locked to either '1' or '0' is another security feature which ensures that a customer lockable device cannot be used instead of a factory locked one.

Bit DQ7 is the most significant bit in the Extended Block Verify Code and a specific procedure must be followed to read it. See "Extended Memory Block Verify Code" in [Table 2., Bus Operations, BYTE = V<sub>IL</sub>](#) and [Table 3., Bus Operations, BYTE = V<sub>IH</sub>](#), for details of how to read bit DQ7.

The Extended Block can only be accessed when the device is in Extended Block mode. For details of how the Extended Block mode is entered and exited, refer to the [Enter Extended Block Command](#) and [Exit Extended Block Command](#) paragraphs, and to [Table 4., Commands, 16-bit mode, BYTE = V<sub>IH</sub>](#) and [Table 5., Commands, 8-bit mode, BYTE = V<sub>IL</sub>](#).

### Factory Locked Extended Block

In devices where the Extended Block is factory locked, the Security Identification Number is written to the Extended Block address space (see [Table 27., Extended Block Address and Data](#)) in the factory. The DQ7 bit is set to '1' and the Extended Block cannot be unprotected.

### Customer Lockable Extended Block

A device where the Extended Block is customer lockable is delivered with the DQ7 bit set to '0' and the Extended Block unprotected. It is up to the customer to program and protect the Extended Block but care must be taken because the protection of the Extended Block is not reversible.

There are two ways of protecting the Extended Block:

- Issue the Enter Extended Block command to place the device in Extended Block mode, then use the In-System Technique with RP either at V<sub>IH</sub> or at V<sub>ID</sub> (refer to [APPENDIX D., In-System Technique](#) and to the corresponding flowcharts, Figures 18 and 19, for a detailed explanation of the technique).
- Issue the Enter Extended Block command to place the device in Extended Block mode, then use the Programmer Technique (refer to [APPENDIX D., Programmer Technique](#) and to the corresponding flowcharts, Figures 16 and 17, for a detailed explanation of the technique).

Once the Extended Block is programmed and protected, the Exit Extended Block command must be issued to exit the Extended Block mode and return the device to Read mode.

**Table 27. Extended Block Address and Data**

| Device    | Address <sup>(1)</sup> |                  | Data                           |                        |
|-----------|------------------------|------------------|--------------------------------|------------------------|
|           | x8                     | x16              | Factory Locked                 | Customer Lockable      |
| M29W640DT | 7F0000h-7F000Fh        | 3F8000h-3F8007h  | Security Identification Number | Determined by Customer |

Note: 1. See Tables 19 and 20, Top and Bottom Boot Block Addresses.

## APPENDIX D. BLOCK PROTECTION

Block protection can be used to prevent any operation from modifying the data stored in the memory. The blocks are protected in groups, refer to [APPENDIX A.](#), [Table 19.](#) and [Table 20.](#) for details of the Protection Groups. Once protected, Program and Erase operations within the protected group fail to change the data.

There are three techniques that can be used to control Block Protection, these are the Programmer technique, the In-System technique and Temporary Unprotection. Temporary Unprotection is controlled by the Reset/Block Temporary Unprotection pin,  $\overline{RP}$ ; this is described in the Signal Descriptions section.

### Programmer Technique

The Programmer technique uses high ( $V_{ID}$ ) voltage levels on some of the bus pins. These cannot be achieved using a standard microprocessor bus, therefore the technique is recommended only for use in Programming Equipment.

To protect a group of blocks follow the flowchart in [Figure 16.](#), [Programmer Equipment Group Protect Flowchart](#). To unprotect the whole chip it is necessary to protect all of the groups first, then all groups can be unprotected at the same time. To unprotect the chip follow [Figure 17.](#), [Programmer Equipment Chip Unprotect Flowchart](#). [Table 28.](#), [Programmer Technique Bus Operations](#),  $BYTE = V_{IH}$  or  $V_{IL}$ , gives a summary of each operation.

The timing on these flowcharts is critical. Care should be taken to ensure that, where a pause is

specified, it is followed as closely as possible. Do not abort the procedure before reaching the end. Chip Unprotect can take several seconds and a user message should be provided to show that the operation is progressing.

### In-System Technique

The In-System technique requires a high voltage level on the Reset/Blocks Temporary Unprotect pin,  $\overline{RP}^{(1)}$ . This can be achieved without violating the maximum ratings of the components on the microprocessor bus, therefore this technique is suitable for use after the memory has been fitted to the system.

To protect a group of blocks follow the flowchart in [Figure 18.](#), [In-System Equipment Group Protect Flowchart](#). To unprotect the whole chip it is necessary to protect all of the groups first, then all the groups can be unprotected at the same time. To unprotect the chip follow [Figure 19.](#), [In-System Equipment Chip Unprotect Flowchart](#).

The timing on these flowcharts is critical. Care should be taken to ensure that, where a pause is specified, it is followed as closely as possible. Do not allow the microprocessor to service interrupts that will upset the timing and do not abort the procedure before reaching the end. Chip Unprotect can take several seconds and a user message should be provided to show that the operation is progressing.

Note: 1.  $\overline{RP}$  can be either at  $V_{IH}$  or at  $V_{ID}$  when using the In-System Technique to protect the Extended Block.

**Table 28. Programmer Technique Bus Operations,  $BYTE = V_{IH}$  or  $V_{IL}$**

SO44 package removed. Double Word Program Time (typ) changed to 20s. Revision numbering modified: a minor revision will be indicated by incrementing the digit after the dot, and a major revision, by incrementing the digit before the dot (revision version 03 equals 3.0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 08-Jan-2003 | 3.2     | Values corrected for typical times for Double Word Program (Byte or Word) and Chip Program (Quadruple Byte, Double Word) in the Program, Erase Times and Program, Erase Endurance Cycles table.<br>Document promoted from Product Preview to Preliminary Data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 04-Apr-2003 | 3.3     | Data Retention and Erase Suspend Latency Time parameters added to <a href="#">Table 6.</a> , <a href="#">Program, Erase Times and Program, Erase Endurance Cycles</a> , and Typical after 100k W/E Cycles column removed.<br>I <sub>ID</sub> (Identification) current removed from <a href="#">Table 11.</a> , <a href="#">DC Characteristics</a> . Data modified at addresses 2Eh, 31h, 32h in <a href="#">Table 24</a> .<br>Extended Memory Block Verify Codes modified in <a href="#">Tables 2 and 3</a> , " <a href="#">Bus Operations, BYTE = V<sub>IL</sub></a> " and " <a href="#">Bus Operations, BYTE = V<sub>IH</sub></a> ", respectively. Block 75 address space corrected for x8 mode in <a href="#">Table 19.</a> , <a href="#">Top Boot Block Addresses, M29W640DT</a> , and Block 71 address space corrected for x8 mode in <a href="#">Table 20.</a> , <a href="#">Bottom Boot Block Addresses, M29W640DB</a> .<br><a href="#">APPENDIX C.</a> , <a href="#">EXTENDED MEMORY BLOCK</a> , added. V <sub>SS</sub> pin connection to ground clarified.<br>Lead-free package options E and F added to <a href="#">Table 18.</a> , <a href="#">Ordering Information Scheme</a> . |
| 2-Oct-2003  | 3.4     | Status of Ready/Busy signal for Erase Suspend Operation modified in <a href="#">Table 7</a> , Status Register Bits.<br>Double Word Program Command modified in <a href="#">COMMAND INTERFACE</a> section.<br>TLEAD parameter added in <a href="#">Table 8.</a> , <a href="#">Absolute Maximum Ratings</a> .<br>Note modified and addresses 31h to 3Ch added in <a href="#">Table 24.</a> , <a href="#">Device Geometry Definition</a> .<br>Addresses 43h and 4Eh modified; addresses 4Fh and 50h added in <a href="#">Table 25.</a> , <a href="#">Primary Algorithm-Specific Extended Query Table</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 10-Nov-2003 | 3.5     | 70ns access time option removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
