IS41C16105
IS41LV16105

1M x 16   (16-MBIT) DYNAMIC RAM WITH FAST PAGE MODE

FEATURES

- TTL compatible inputs and outputs; tristate I/O
- Refresh Interval: 1,024 cycles/16 ms
- Refresh Mode: $\overline{RAS}$-Only, $\overline{CAS}$-before-$\overline{RAS}$ (CBR), Hidden
- JEDEC standard pinout
- Single power supply:
    5V ± 10% (IS41C16105)
    3.3V ± 10% (IS41LV16105)
- Byte Write and Byte Read operation via two $\overline{CAS}$
- Industrail temperature range -40°C to 85°C

DESCRIPTION

The *ICSI* IS41C16105 and IS41LV16105 are 1,048,576 x 16-bit high-performance CMOS Dynamic Random Access Memories. Fast Page Mode allows 1,024 random accesses within a single row with access cycle time as short as 20 ns per 16-bit word. The Byte Write control, of upper and lower byte, makes the IS41C16105 ideal for use in 16-, 32-bit wide data bus systems.

These features make the IS41C16105 and IS41LV16105 ideally suited for high-bandwidth graphics, digital signal processing, high-performance computing systems, and peripheral applications.
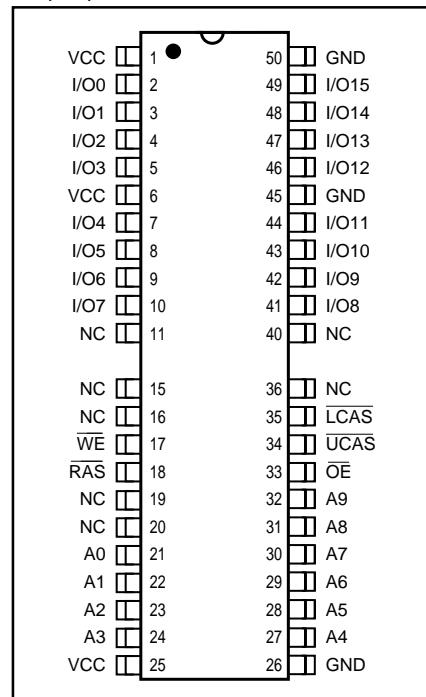

The IS41C16105 and IS41LV16105 are packaged in a 42-pin 400mil SOJ and 400mil 44- (50-) pin TSOP-2.

Notes:
1. These WRITE cycles may also be BYTE WRITE cycles (either $\overline{LCAS}$ or $\overline{UCAS}$ active).
2. These READ cycles may also be BYTE READ cycles (either $\overline{LCAS}$ or $\overline{UCAS}$ active).
3. EARLY WRITE only.
4. At least one of the two $\overline{CAS}$ signals must be active ($\overline{LCAS}$ or $\overline{UCAS}$).

Functional Description

The IS41C16105 and IS41LV16105 is a CMOS DRAM optimized for high-speed bandwidth, low power applications. During READ or WRITE cycles, each bit is uniquely addressed through the 10 address bits. These are entered ten bits (A0-A9) at a time. The row address is latched by the Row Address Strobe ($\overline{RAS}$). The column address is latched by the Column Address Strobe ($\overline{CAS}$). $\overline{RAS}$ is used to latch the first ten bits and $\overline{CAS}$ is used the latter ten bits.

The IS41C16105 and IS41LV16105 has two $\overline{CAS}$ controls, $\overline{LCAS}$ and $\overline{UCAS}$. The $\overline{LCAS}$ and $\overline{UCAS}$ inputs internally generates a $\overline{CAS}$ signal functioning in an identical manner to the single $\overline{CAS}$ input on the other 1M x 16 DRAMs. The key difference is that each $\overline{CAS}$ controls its corresponding I/O tristate logic (in conjunction with $\overline{OE}$ and $\overline{WE}$ and $\overline{RAS}$). $\overline{LCAS}$ controls I/O0 through I/O7 and $\overline{UCAS}$ controls I/O8 through I/O15.

The IS41C16105 and IS41LV16105 $\overline{CAS}$ function is determined by the first $\overline{CAS}$ ($\overline{LCAS}$ or $\overline{UCAS}$) transitioning LOW and the last transitioning back HIGH. The two $\overline{CAS}$ controls give the IS41C16105 and IS41LV16105 both BYTE READ and BYTE WRITE cycle capabilities.

Memory Cycle

A memory cycle is initiated by bring $\overline{RAS}$ LOW and it is terminated by returning both $\overline{RAS}$ and $\overline{CAS}$ HIGH. To ensures proper device operation and data integrity any memory cycle, once initiated, must not be ended or aborted before the minimum t_{RAS} time has expired. A new cycle must not be initiated until the minimum precharge time t_{RP}, t_{CP} has elapsed.

Read Cycle

A read cycle is initiated by the falling edge of $\overline{CAS}$ or $\overline{OE}$, whichever occurs last, while holding $\overline{WE}$ HIGH. The column address must be held for a minimum time specified by t_{AR}. Data Out becomes valid only when t_{RAC}, t_{AA}, t_{CAC} and t_{OEA} are all satisfied. As a result, the access time is dependent on the timing relationships between these parameters.

Write Cycle

A write cycle is initiated by the falling edge of $\overline{CAS}$ and $\overline{WE}$, whichever occurs last. The input data must be valid at or before the falling edge of $\overline{CAS}$ or $\overline{WE}$, whichever occurs last.

Refresh Cycle

To retain data, 1,024 refresh cycles are required in each 16 ms period. There are two ways to refresh the memory.

1. By clocking each of the 1,024 row addresses (A0 through A9) with $\overline{RAS}$ at least once every 16 ms. Any read, write, read-modify-write or $\overline{RAS}$-only cycle refreshes the addressed row.

2. Using a $\overline{CAS}$-before-$\overline{RAS}$ refresh cycle. $\overline{CAS}$-before-$\overline{RAS}$ refresh is activated by the falling edge of $\overline{RAS}$, while holding $\overline{CAS}$ LOW. In $\overline{CAS}$-before-$\overline{RAS}$ refresh cycle, an internal 10-bit counter provides the row addresses and the external address inputs are ignored.

$\overline{CAS}$-before-$\overline{RAS}$ is a refresh-only mode and no data access or device selection is allowed. Thus, the output remains in the High-Z state during the cycle.

Power-On

After application of the V_{CC} supply, an initial pause of 200 μs is required followed by a minimum of eight initialization cycles (any combination of cycles containing a $\overline{RAS}$ signal).

During power-on, it is recommended that $\overline{RAS}$ track with V_{CC} or be held at a valid V_{IH} to avoid current surges.

ABSOLUTE MAXIMUM RATINGS[1]

Note:

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes:

1. An initial pause of 200 μs is required after power-up followed by eight $\overline{RAS}$ refresh cycles ($\overline{RAS}$-Only or CBR) before proper device operation is assured.   The eight $\overline{RAS}$ cycles wake-up should be repeated any time the t_{REF} refresh requirement is exceeded.
2. Dependent on cycle rates.
3. Specified values are obtained with minimum cycle time and the output open.
4. Column-address is changed once each Fast page cycle.
5. Enables on-chip refresh and address counters.

Notes:

1. An initial pause of 200 μs is required after power-up followed by eight $\overline{RAS}$ refresh cycle ($\overline{RAS}$-Only or CBR) before proper device operation is assured. The eight $\overline{RAS}$ cycles wake-up should be repeated any time the t_{REF} refresh requirement is exceeded.

2. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times, are measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) and assume to be 1 ns for all inputs.

3. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

4. If $\overline{CAS}$ and $\overline{RAS}$ = V_{IH}, data output is High-Z.

5. If $\overline{CAS}$ = V_{IL}, data output may contain data from the last valid READ cycle.

6. Measured with a load equivalent to one TTL gate and 50 pF.

7. Assumes that $t_{RCD} \leq t_{RCD}$ (MAX). If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by the amount that t_{RCD} exceeds the value shown.

8. Assumes that $t_{RCD} \geq t_{RCD}$ (MAX).

9. If $\overline{CAS}$ is LOW at the falling edge of $\overline{RAS}$, data out will be maintained from the previous cycle. To initiate a new cycle and clear the data output buffer, $\overline{CAS}$ and $\overline{RAS}$ must be pulsed for t_{CP}.

10. Operation with the t_{RCD} (MAX) limit ensures that t_{RAC} (MAX) can be met. t_{RCD} (MAX) is specified as a reference point only; if t_{RCD} is greater than the specified t_{RCD} (MAX) limit, access time is controlled exclusively by t_{CAC}.

11. Operation within the t_{RAD} (MAX) limit ensures that t_{RCD} (MAX) can be met. t_{RAD} (MAX) is specified as a reference point only; if t_{RAD} is greater than the specified t_{RAD} (MAX) limit, access time is controlled exclusively by t_{AA}.

12. Either t_{RCH} or t_{RRH} must be satisfied for a READ cycle.

13. t_{OFF} (MAX) defines the time at which the output achieves the open circuit condition; it is not a reference to V_{OH} or V_{OL}.

14. t_{WCS}, t_{RWD}, t_{AWD} and t_{CWD} are restrictive operating parameters in LATE WRITE and READ-MODIFY-WRITE cycle only. If $t_{WCS} \geq t_{WCS}$ (MIN), the cycle is an EARLY WRITE cycle and the data output will remain open circuit throughout the entire cycle. If $t_{RWD} \geq t_{RWD}$ (MIN), $t_{AWD} \geq t_{AWD}$ (MIN) and $t_{CWD} \geq t_{CWD}$ (MIN), the cycle is a READ-WRITE cycle and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of I/O (at access time and until $\overline{CAS}$ and $\overline{RAS}$ or $\overline{OE}$ go back to V_{IH}) is indeterminate. $\overline{OE}$ held HIGH and $\overline{WE}$ taken LOW after $\overline{CAS}$ goes LOW result in a LATE WRITE ($\overline{OE}$-controlled) cycle.

15. Output parameter (I/O) is referenced to corresponding $\overline{CAS}$ input, I/O0-I/O7 by $\overline{LCAS}$ and I/O8-I/O15 by $\overline{UCAS}$.

16. During a READ cycle, if $\overline{OE}$ is LOW then taken HIGH before $\overline{CAS}$ goes HIGH, I/O goes open. If $\overline{OE}$ is tied permanently LOW, a LATE WRITE or READ-MODIFY-WRITE is not possible.

17. Write command is defined as $\overline{WE}$ going low.

18. LATE WRITE and READ-MODIFY-WRITE cycles must have both t_{OD} and t_{OEH} met ($\overline{OE}$ HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The I/Os will provide the previously written data if $\overline{CAS}$ remains LOW and $\overline{OE}$ is taken back to LOW after t_{OEH} is met.

19. The I/Os are in open during READ cycles once t_{OD} or t_{OFF} occur.

20. The first $\chi\overline{CAS}$ edge to transition LOW.

21. The last $\chi\overline{CAS}$ edge to transition HIGH.

22. These parameters are referenced to $\overline{CAS}$ leading edge in EARLY WRITE cycles and $\overline{WE}$ leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.

23. Last falling $\chi\overline{CAS}$ edge to first rising $\chi\overline{CAS}$ edge.

24. Last rising $\chi\overline{CAS}$ edge to next cycle's last rising $\chi\overline{CAS}$ edge.

25. Last rising $\chi\overline{CAS}$ edge to first falling $\chi\overline{CAS}$ edge.

26. Each $\chi\overline{CAS}$ must meet minimum pulse width.

27. Last $\chi\overline{CAS}$ to go LOW.

28. I/Os controlled, regardless $\overline{UCAS}$ and $\overline{LCAS}$.

29. The 3 ns minimum is a parameter guaranteed by design.

30. Enables on-chip refresh and address counters.
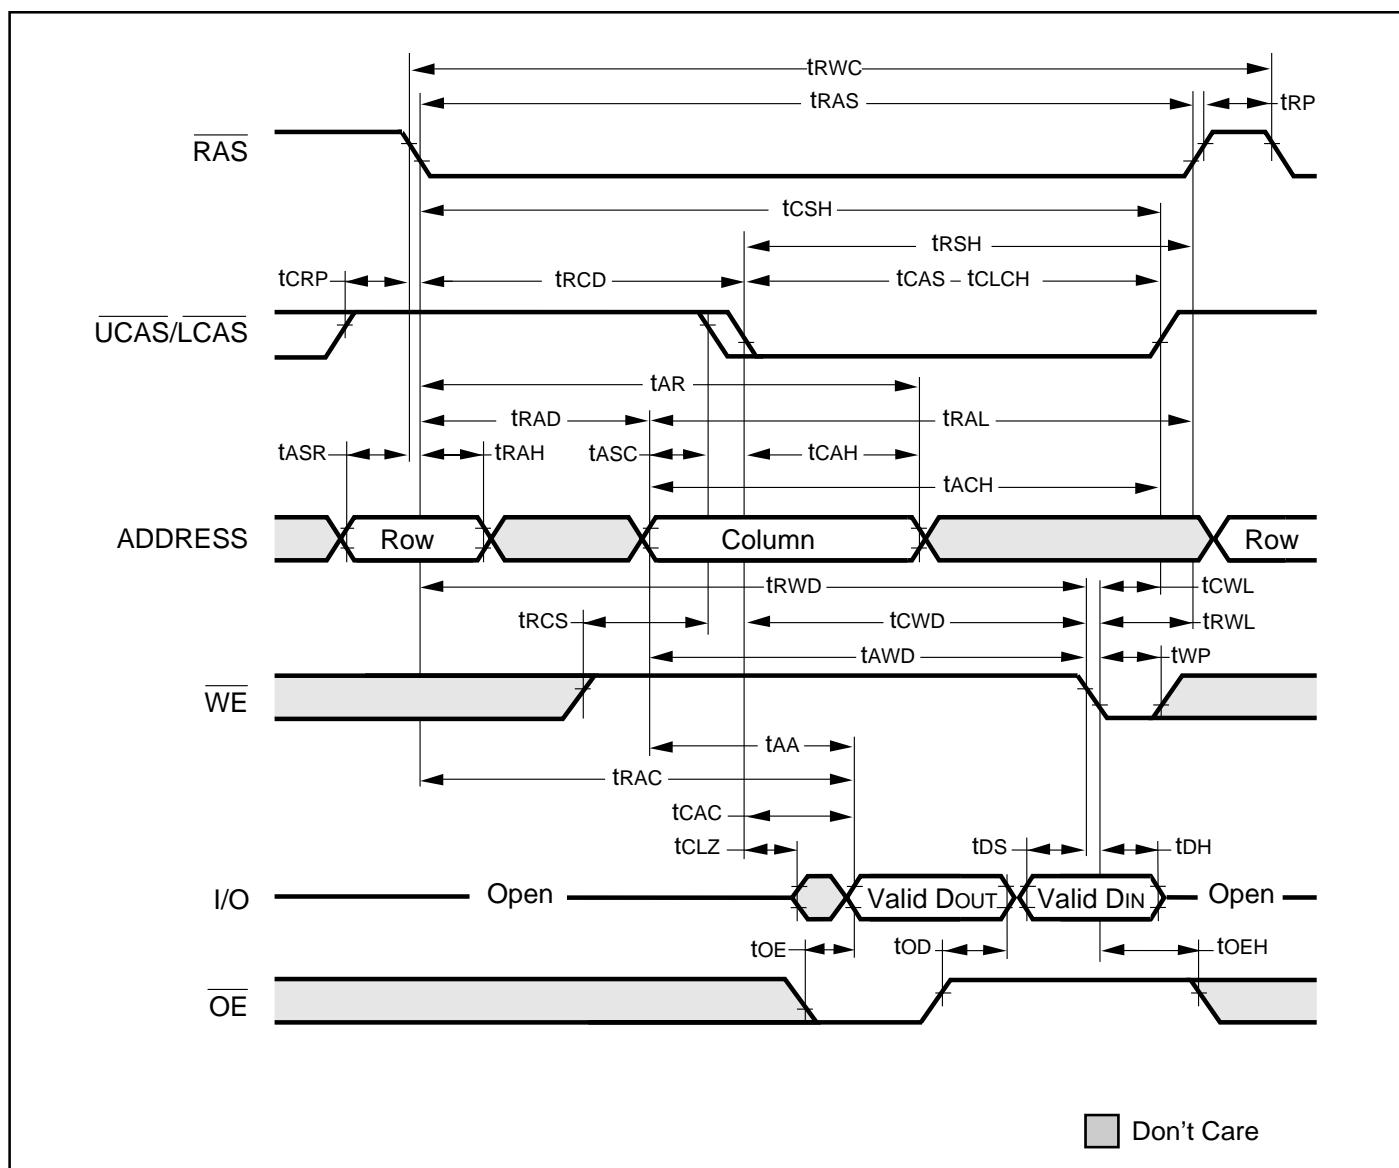

READ CYCLE
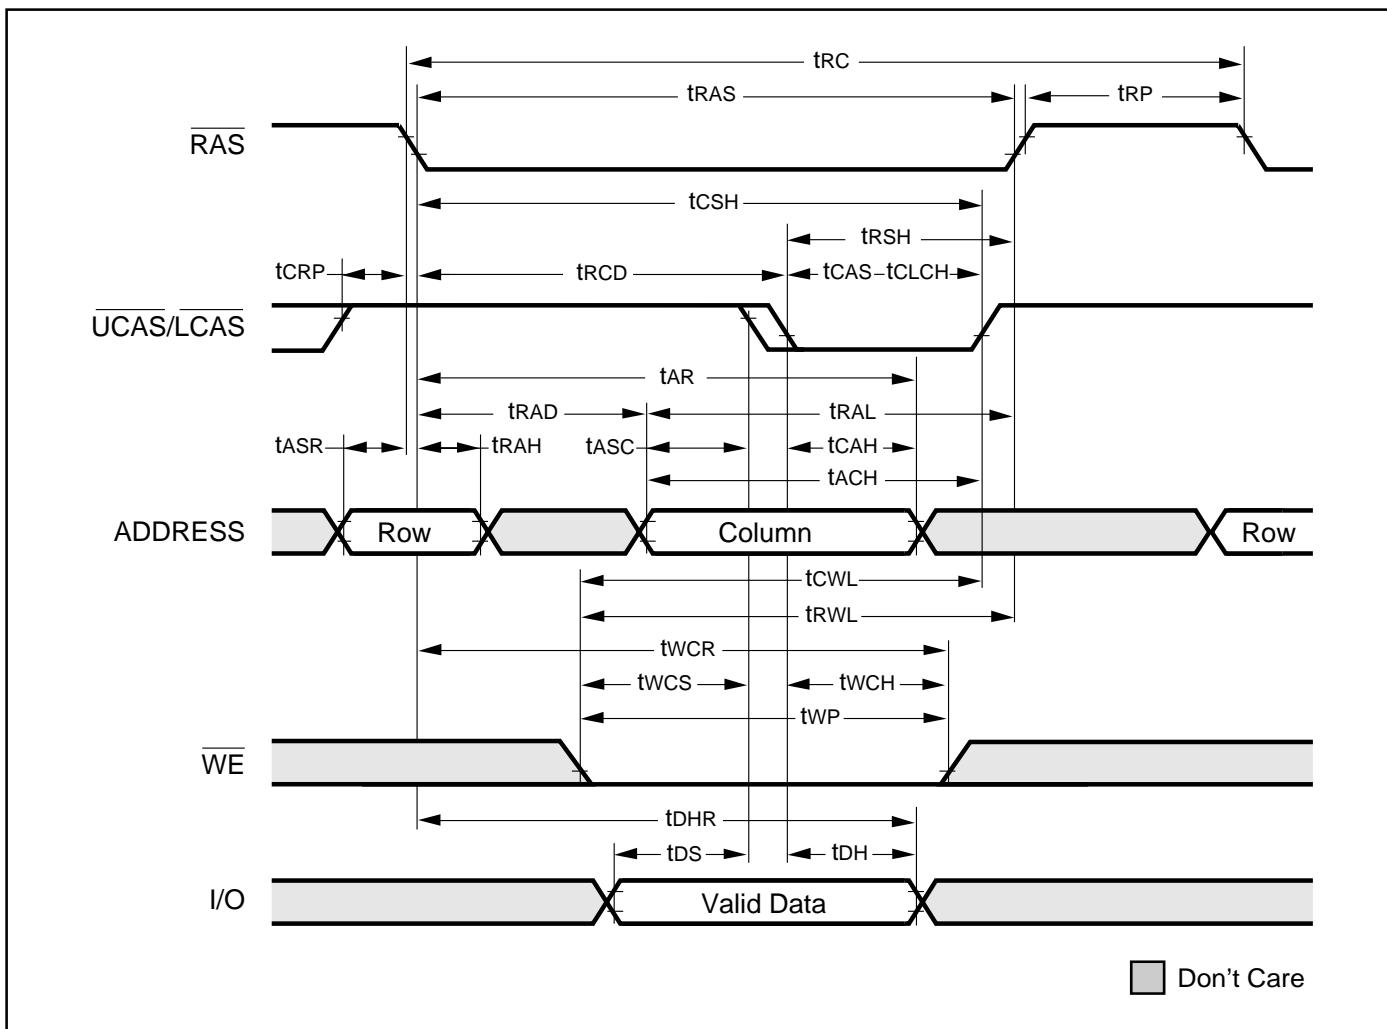

Note:
1. t_{OFF} is referenced from rising edge of $\overline{RAS}$ or $\overline{CAS}$, whichever occurs last.

## $\overline{RAS}$-ONLY REFRESH CYCLE ($\overline{OE}$, $\overline{WE}$ = DON'T CARE)

$\overline{\text{CBR}}$ REFRESH CYCLE (Addresses; $\overline{\text{WE}}$, $\overline{\text{OE}}$ = DON'T CARE)

HIDDEN REFRESH CYCLE[1] ($\overline{\text{WE}}$ = HIGH; $\overline{\text{OE}}$ = LOW)

Notes:
1. A Hidden Refresh may also be performed after a Write Cycle. In this case, $\overline{\text{WE}}$ = LOW and $\overline{\text{OE}}$ = HIGH.
2. t_{OFF} is referenced from rising edge of $\overline{\text{RAS}}$ or $\overline{\text{CAS}}$, whichever occurs last.
