

## Features

- 20 ns, 25 ns, and 45 ns access times
- Internally organized as 512 K × 8 (CY14B104LA) or 256 K × 16 (CY14B104NA)
- Hands off automatic STORE on power-down with only a small capacitor
- STORE to QuantumTrap non-volatile elements initiated by software, device pin, or AutoStore on power-down
- RECALL to SRAM initiated by software or power-up
- Infinite read, write, and recall cycles
- 1 million STORE cycles to QuantumTrap
- 20 year data retention
- Single 3 V +20%, -10% operation
- Industrial temperature

## Logic Block Diagram [1, 2, 3]

### Notes

1. Address A<sub>0</sub>–A<sub>18</sub> for × 8 configuration and Address A<sub>0</sub>–A<sub>17</sub> for × 16 configuration.
2. Data DQ<sub>0</sub>–DQ<sub>7</sub> for × 8 configuration and Data DQ<sub>0</sub>–DQ<sub>15</sub> for × 16 configuration.
3. BHE and BLE are applicable for × 16 configuration only.

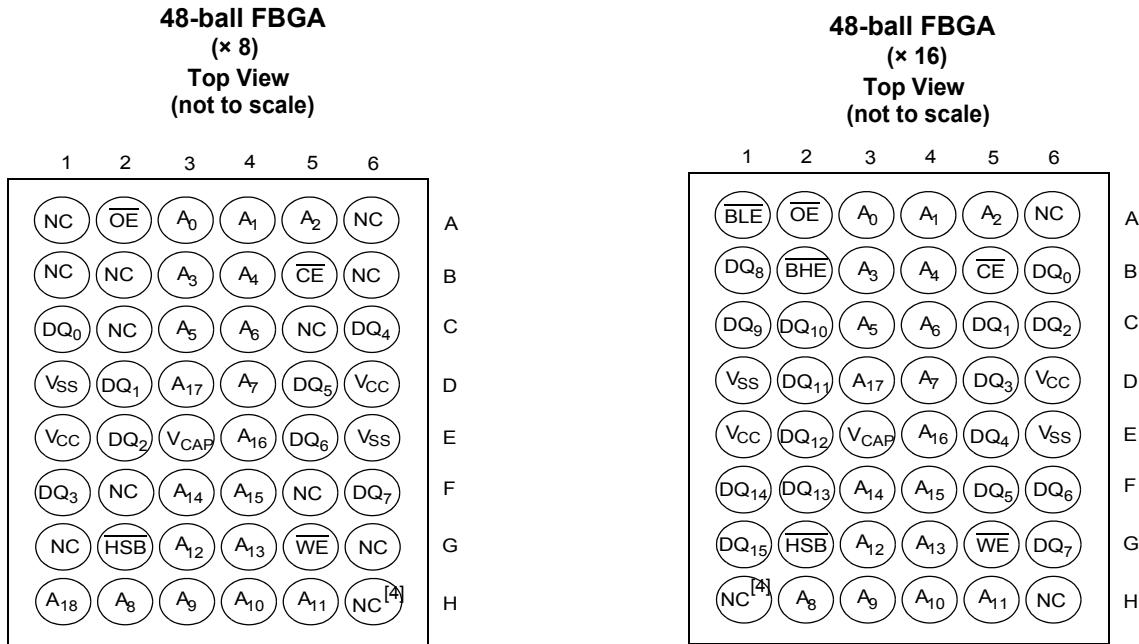

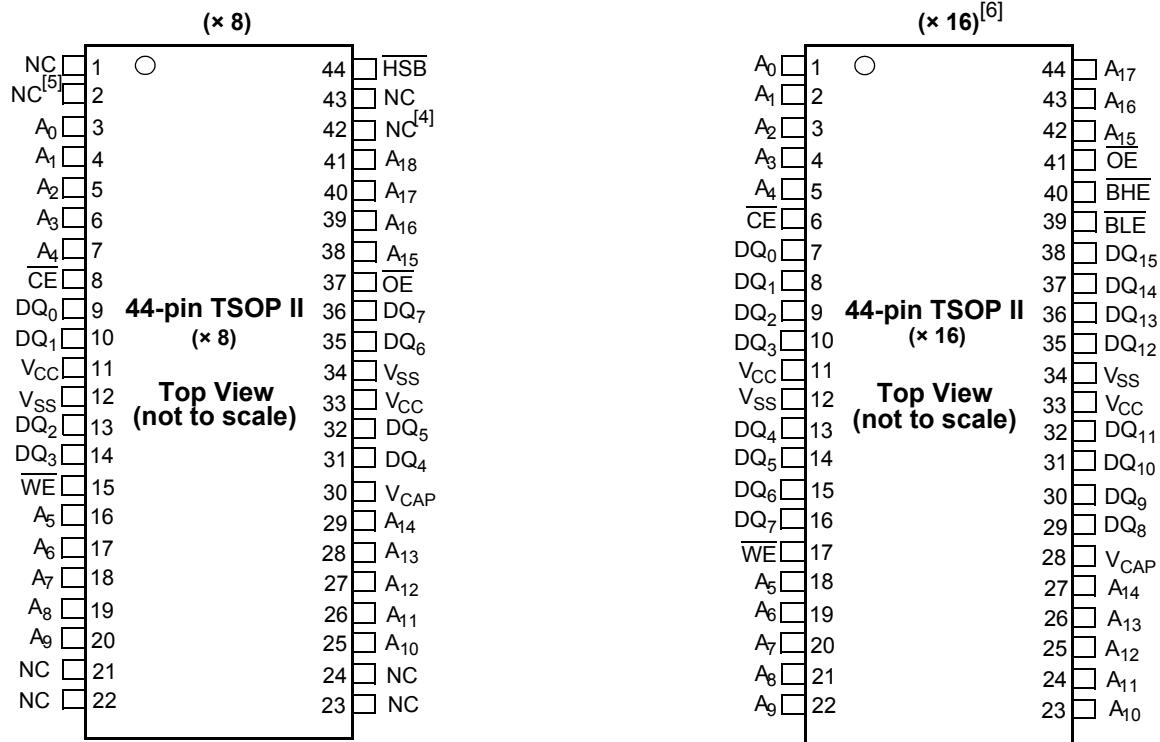

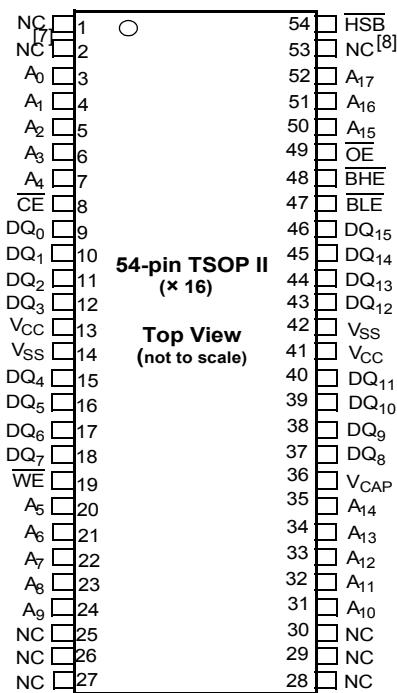

Figure 2. 44-pin TSOP II pinouts

### Notes

4. Address expansion for 8-Mbit. NC pin not connected to die.
5. Address expansion for 16-Mbit. NC pin not connected to die.
6. HSB pin is not available in 44-pin TSOP II (x 16) package.

**Pinouts** (continued)

**Figure 3. Pin Diagram – 54-pin TSOP II pinout**

**Pin Definitions**

Pin Name	I/O Type	Description
A <sub>0</sub> –A <sub>18</sub>	Input	<b>Address inputs.</b> Used to select one of the 524,288 bytes of the nvSRAM for $\times 8$ Configuration.
A <sub>0</sub> –A <sub>17</sub>		<b>Address inputs.</b> Used to Select one of the 262,144 words of the nvSRAM for $\times 16$ Configuration.
DQ <sub>0</sub> –DQ <sub>7</sub>	Input/Output	<b>Bidirectional data I/O lines for <math>\times 8</math> configuration.</b> Used as input or output lines depending on operation.
DQ <sub>0</sub> –DQ <sub>15</sub>		<b>Bidirectional data I/O lines for <math>\times 16</math> configuration.</b> Used as input or output lines depending on operation.
WE	Input	<b>Write Enable input, Active LOW.</b> When selected LOW, data on the I/O pins is written to the specific address location.
CE	Input	<b>Chip Enable input, Active LOW.</b> When LOW, selects the chip. When HIGH, deselects the chip.
OE	Input	<b>Output Enable, Active LOW.</b> The active LOW OE input enables the data output buffers during read cycles. I/O pins are tristated on deasserting OE HIGH.
BHE	Input	<b>Byte High Enable, Active LOW.</b> Controls DQ <sub>15</sub> –DQ <sub>8</sub> .
BLE	Input	<b>Byte Low Enable, Active LOW.</b> Controls DQ <sub>7</sub> –DQ <sub>0</sub> .
V <sub>SS</sub>	Ground	<b>Ground for the device.</b> Must be connected to the ground of the system.
V <sub>CC</sub>	Power supply	<b>Power supply inputs to the device.</b>
HSB <sup>[9]</sup>	Input/Output	<b>Hardware STORE Busy (HSB).</b> When LOW this output indicates that a Hardware STORE is in progress. When pulled LOW external to the chip it initiates a non-volatile STORE operation. After each Hardware and Software STORE operation, HSB is driven HIGH for a short time ( $t_{HHD}$ ) with standard output high current, and then a weak internal pull-up resistor keeps this pin HIGH (external pull-up resistor connection optional).
V <sub>CAP</sub>	Power supply	<b>AutoStore Capacitor.</b> Supplies power to the nvSRAM during power loss to store data from SRAM to non-volatile elements.
NC	No connect	<b>No Connect.</b> This pin is not connected to the die.

**NOTES**

7. Address expansion for 16-Mbit. NC pin not connected to die.
8. Address expansion for 8-Mbit. NC pin not connected to die.
9. HSB pin is not available in 44-pin TSOP II ( $\times 16$ ) package.

## Device Operation

The CY14B104LA/CY14B104NA nvSRAM is made up of two functional components paired in the same physical cell. They are a SRAM memory cell and a non-volatile QuantumTrap cell. The SRAM memory cell operates as a standard fast static RAM. Data in the SRAM is transferred to the non-volatile cell (the STORE operation), or from the non-volatile cell to the SRAM (the RECALL operation). Using this unique architecture, all cells are stored and recalled in parallel. During the STORE and RECALL operations, SRAM read and write operations are inhibited. The CY14B104LA/CY14B104NA supports infinite reads and writes similar to a typical SRAM. In addition, it provides infinite RECALL operations from the non-volatile cells and up to 1 million STORE operations. Refer to the [Truth Table For SRAM Operations on page 17](#) for a complete description of read and write modes.

### SRAM Read

The CY14B104LA/CY14B104NA performs a read cycle when CE and OE are LOW and WE and HSB are HIGH. The address specified on pins A<sub>0-18</sub> or A<sub>0-17</sub> determines which of the 524,288 data bytes or 262,144 words of 16 bits each are accessed. Byte enables (BHE, BLE) determine which bytes are enabled to the output, in the case of 16-bit words. When the read is initiated by an address transition, the outputs are valid after a delay of t<sub>AA</sub> (read cycle 1). If the read is initiated by  $\overline{CE}$  or  $\overline{OE}$ , the outputs are valid at t<sub>ACE</sub> or at t<sub>DOE</sub>, whichever is later (read cycle 2). The data output repeatedly responds to address changes within the t<sub>AA</sub> access time without the need for transitions on any control input pins. This remains valid until another address change or until CE or OE is brought HIGH, or WE or HSB is brought LOW.

### SRAM Write

A write cycle is performed when  $\overline{CE}$  and  $\overline{WE}$  are LOW and  $\overline{HSB}$  is HIGH. The address inputs must be stable before entering the write cycle and must remain stable until CE or WE goes HIGH at the end of the cycle. The data on the common I/O pins DQ<sub>0-15</sub> are written into the memory if the data is valid (t<sub>SD</sub> time) before the end of a WE controlled write or before the end of an CE controlled write. The Byte Enable inputs (BHE, BLE) determine which bytes are written, in the case of 16-bit words. It is recommended that OE be kept HIGH during the entire write cycle to avoid data bus contention on common I/O lines. If OE is left LOW, internal circuitry turns off the output buffers t<sub>HZWE</sub> after WE goes LOW.

### AutoStore Operation

The CY14B104LA/CY14B104NA stores data to the nvSRAM using one of the following three storage operations: Hardware STORE activated by the HSB; Software STORE activated by an address sequence; AutoStore on device power-down. The AutoStore operation is a unique feature of QuantumTrap technology and is enabled by default on the CY14B104LA/CY14B104NA.

During a normal operation, the device draws current from V<sub>CC</sub> to charge a capacitor connected to the V<sub>CAP</sub> pin. This stored charge is used by the chip to perform a single STORE operation. If the voltage on the V<sub>CC</sub> pin drops below V<sub>SWITCH</sub>, the part

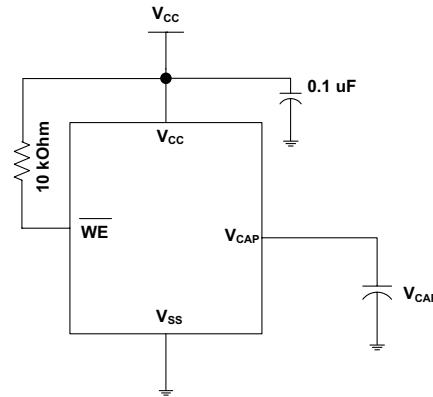

automatically disconnects the V<sub>CAP</sub> pin from V<sub>CC</sub>. A STORE operation is initiated with power provided by the V<sub>CAP</sub> capacitor.

**Note** If the capacitor is not connected to V<sub>CAP</sub> pin, AutoStore must be disabled using the soft sequence specified in [Preventing AutoStore on page 7](#). In case AutoStore is enabled without a capacitor on V<sub>CAP</sub> pin, the device attempts an AutoStore operation without sufficient charge to complete the Store. This corrupts the data stored in nvSRAM.

Figure 4 shows the proper connection of the storage capacitor (V<sub>CAP</sub>) for automatic store operation. Refer to [DC Electrical Characteristics on page 8](#) for the size of V<sub>CAP</sub>. The voltage on the V<sub>CAP</sub> pin is driven to V<sub>CC</sub> by a regulator on the chip. A pull-up should be placed on WE to hold it inactive during power-up. This pull-up is effective only if the WE signal is tristate during power-up. Many MPUs tristate their controls on power-up. This should be verified when using the pull-up. When the nvSRAM comes out of power-on-RECALL, the MPU must be active or the WE held inactive until the MPU comes out of reset.

To reduce unnecessary non-volatile stores, AutoStore and hardware STORE operations are ignored unless at least one write operation has taken place since the most recent STORE or RECALL cycle. Software initiated STORE cycles are performed regardless of whether a write operation has taken place. The HSB signal is monitored by the system to detect if an AutoStore cycle is in progress.

**Figure 4. AutoStore Mode**

### Hardware STORE Operation

The CY14B104LA/CY14B104NA provides the HSB<sup>[10]</sup> pin to control and acknowledge the STORE operations. The HSB pin is used to request a hardware STORE cycle. When the HSB pin is driven LOW, the CY14B104LA/CY14B104NA conditionally initiates a STORE operation after t<sub>DELAY</sub>. An actual STORE cycle only begins if a write to the SRAM has taken place since the last STORE or RECALL cycle. The HSB pin also acts as an open drain driver (internal 100 kΩ weak pull-up resistor) that is internally driven LOW to indicate a busy condition when the STORE (initiated by any means) is in progress.

**Note** After each Hardware and Software STORE operation HSB is driven HIGH for a short time (t<sub>HHHD</sub>) with standard output high current and then remains HIGH by internal 100 kΩ pull-up resistor.

**Note**

10. HSB pin is not available in 44-pin TSOP II ( $\times 16$ ) package.

SRAM write operations that are in progress when HSB is driven LOW by any means are given time ( $t_{DELAY}$ ) to complete before the STORE operation is initiated. However, any SRAM write cycles requested after HSB goes LOW are inhibited until HSB returns HIGH. In case the write latch is not set, HSB is not driven LOW by the CY14B104LA/CY14B104NA. But any SRAM read and write cycles are inhibited until HSB is returned HIGH by MPU or other external source.

During any STORE operation, regardless of how it is initiated, the CY14B104LA/CY14B104NA continues to drive the HSB pin LOW, releasing it only when the STORE is complete. Upon completion of the STORE operation, the nvSRAM memory access is inhibited for  $t_{LZHSB}$  time after HSB pin returns HIGH. Leave the HSB unconnected if it is not used.

### Hardware RECALL (Power-Up)

During power-up or after any low power condition ( $V_{CC} < V_{SWITCH}$ ), an internal RECALL request is latched. When  $V_{CC}$  again exceeds the  $V_{SWITCH}$  on power up, a RECALL cycle is automatically initiated and takes  $t_{HRECALL}$  to complete. During this time, the HSB pin is driven LOW by the HSB driver and all reads and writes to nvSRAM are inhibited.

### Software STORE

Data is transferred from the SRAM to the non-volatile memory by a software address sequence. The CY14B104LA/CY14B104NA software STORE cycle is initiated by executing sequential CE or OE controlled read cycles from six specific address locations in exact order. During the STORE cycle an erase of the previous non-volatile data is first performed, followed by a program of the non-volatile elements. After a STORE cycle is initiated, further input and output are disabled until the cycle is completed.

Because a sequence of reads from specific addresses is used for STORE initiation, it is important that no other read or write accesses intervene in the sequence, or the sequence is aborted and no STORE or RECALL takes place.

To initiate the software STORE cycle, the following read sequence must be performed.

**Table 1. Mode Selection**

<u>CE</u>	<u>WE</u>	<u>OE</u>	<u>BHE</u> , <u>BLE</u> <sup>[11]</sup>	<u>A<sub>15</sub>–A<sub>0</sub></u> <sup>[12]</sup>	Mode	I/O	Power

L	H	L	L	X	Read SRAM	Output data	Active
L	L	X	L	X	Write SRAM	Input data	Active
L	H	L	X	0x4E38 0xB1C7 0x83E0 0x7C1F 0x703F 0x8B45	Read SRAM Read SRAM Read SRAM Read SRAM Read SRAM AutoStore Disable	Output data Output data Output data Output data Output data Output data	Active <sup>[13]</sup>

#### Notes

11. BHE and BLE are applicable for  $\times 16$  configuration only.
12. While there are 19 address lines on the CY14B104LA (18 address lines on the CY14B104NA), only 13 address lines ( $A_{14}–A_2$ ) are used to control software modes. The remaining address lines are don't care.
13. The six consecutive address locations must be in the order listed. WE must be HIGH during all six cycles to enable a non-volatile cycle.

**Table 1. Mode Selection (continued)**

<b>CE</b>	<b>WE</b>	<b>OE</b>	<b>BHE, BLE<sup>[11]</sup></b>	<b>A<sub>15</sub>-A<sub>0</sub><sup>[12]</sup></b>	<b>Mode</b>	<b>I/O</b>	<b>Power</b>

### Preventing AutoStore

The AutoStore function is disabled by initiating an AutoStore disable sequence. A sequence of read operations is performed in a manner similar to the software STORE initiation. To initiate the AutoStore disable sequence, the following sequence of CE or OE controlled read operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x8B45 AutoStore Disable

The AutoStore is re-enabled by initiating an AutoStore enable sequence. A sequence of read operations is performed in a manner similar to the software RECALL initiation. To initiate the

AutoStore enable sequence, the following sequence of CE or OE controlled read operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x4B46 AutoStore Enable

If the AutoStore function is disabled or re-enabled, a manual STORE operation (hardware or software) must be issued to save the AutoStore state through subsequent power-down cycles. The part comes from the factory with AutoStore enabled and 0x00 written in all cells.

### Data Protection

The CY14B104LA/CY14B104NA protects data from corruption during low voltage conditions by inhibiting all externally initiated STORE and write operations. The low voltage condition is detected when  $V_{CC} < V_{SWITCH}$ . If the CY14B104LA/CY14B104NA is in a write mode (both CE and WE are LOW) at power-up, after a RECALL or STORE, the write is inhibited until the SRAM is enabled after  $t_{LZHSB}$  (HSB to output active). This protects against inadvertent writes during power-up or brown out conditions.

### Note

14. The six consecutive address locations must be in the order listed. WE must be HIGH during all six cycles to enable a non-volatile cycle.

## Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage temperature .....  $-65^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$

Maximum accumulated storage time

At  $150^{\circ}\text{C}$  ambient temperature ..... 1000 h

At  $85^{\circ}\text{C}$  ambient temperature ..... 20 Years

Maximum junction temperature .....  $150^{\circ}\text{C}$

Supply voltage on  $V_{\text{CC}}$  relative to  $V_{\text{SS}}$  .....  $-0.5\text{ V}$  to  $4.1\text{ V}$

Voltage applied to outputs

in high Z state .....  $-0.5\text{ V}$  to  $V_{\text{CC}} + 0.5\text{ V}$

Input voltage .....  $-0.5\text{ V}$  to  $V_{\text{CC}} + 0.5\text{ V}$

Transient voltage ( $< 20\text{ ns}$ ) on any pin to ground potential .....  $-2.0\text{ V}$  to  $V_{\text{CC}} + 2.0\text{ V}$

Package power dissipation capability ( $T_A = 25^{\circ}\text{C}$ ) ..... 1.0 W

Surface mount Pb soldering temperature (3 Seconds) .....  $+260^{\circ}\text{C}$

DC output current (1 output at a time, 1s duration) ..... 15 mA

Static discharge voltage (per MIL-STD-883, Method 3015) .....  $> 2001\text{ V}$

Latch up current .....  $> 200\text{ mA}$

## Operating Range

Range	Ambient Temperature	$V_{\text{CC}}$
Industrial	$-40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$	2.7 V to 3.6 V

## DC Electrical Characteristics

Over the Operating Range

Parameter	Description	Test Conditions	Min	Typ <sup>[15]</sup>	Max	Unit
$V_{\text{CC}}$	Power supply		2.7	3.0	3.6	V
$I_{\text{CC}1}$	Average $V_{\text{CC}}$ current	$t_{\text{RC}} = 20\text{ ns}$ $t_{\text{RC}} = 25\text{ ns}$ $t_{\text{RC}} = 45\text{ ns}$ Values obtained without output loads ( $I_{\text{OUT}} = 0\text{ mA}$ )	—	—	70 70 52	mA mA mA

$\Theta_{JA}$	Thermal resistance (junction to ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, in accordance with EIA/JESD51.	46.09	43.3	42.03	$^\circ C/W$
$\Theta_{JC}$	Thermal resistance (junction to case)		7.84	5.56	6.08	$^\circ C/W$

### Notes

17. Min  $V_{CAP}$  value guarantees that there is a sufficient charge available to complete a successful AutoStore operation. Max  $V_{CAP}$  value guarantees that the capacitor on  $V_{CAP}$  is charged to a minimum voltage during a Power-Up RECALL cycle so that an immediate power-down cycle can complete a successful AutoStore. Therefore it is always recommended to use a capacitor within the specified min and max limits. Refer application note [AN43593](#) for more details on  $V_{CAP}$  options.
18. Maximum voltage on  $V_{CAP}$  pin ( $V_{VCAP}$ ) is provided for guidance when choosing the  $V_{CAP}$  capacitor. The voltage rating of the  $V_{CAP}$  capacitor across the operating temperature range should be higher than the  $V_{VCAP}$  voltage.
19. These parameters are guaranteed by design and are not tested.

$t_{LZWE}$ <sup>[23, 24]</sup>	$t_{OW}$	Output active after end of write	3	—	3	—	3	—	ns
$t_{BW}$	—	Byte enable to end of write	15	—	20	—	30	—	ns

## Switching Waveforms

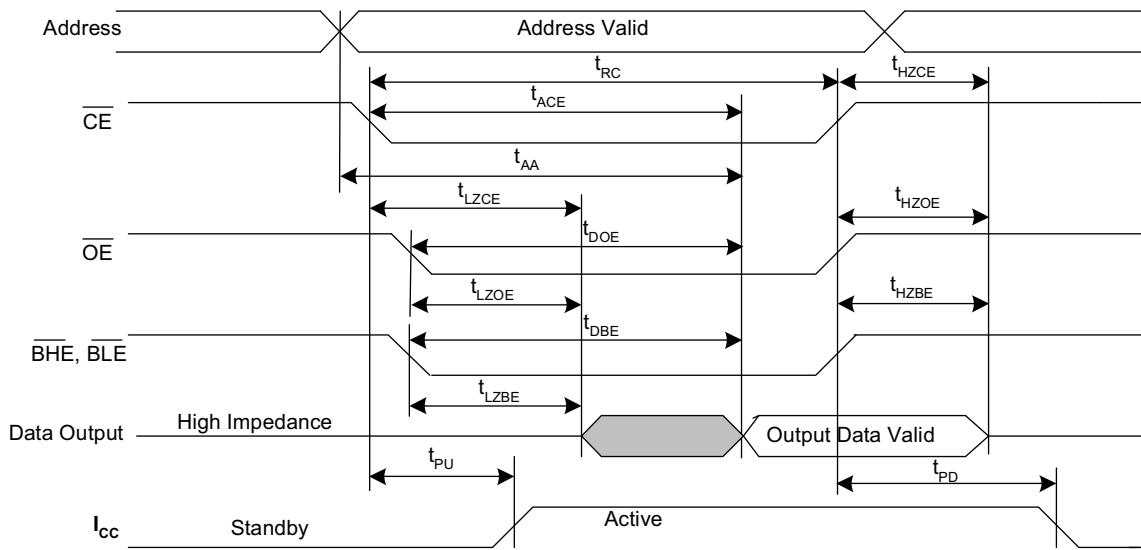

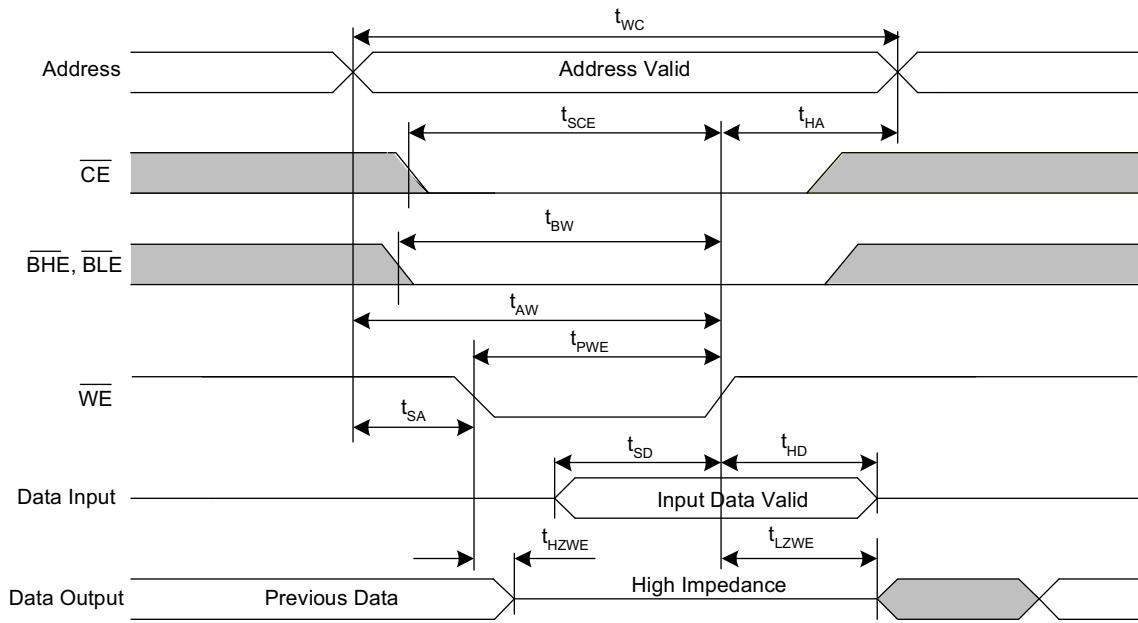

Figure 6. SRAM Read Cycle #1 (Address Controlled)<sup>[21, 22, 26]</sup>

### Notes

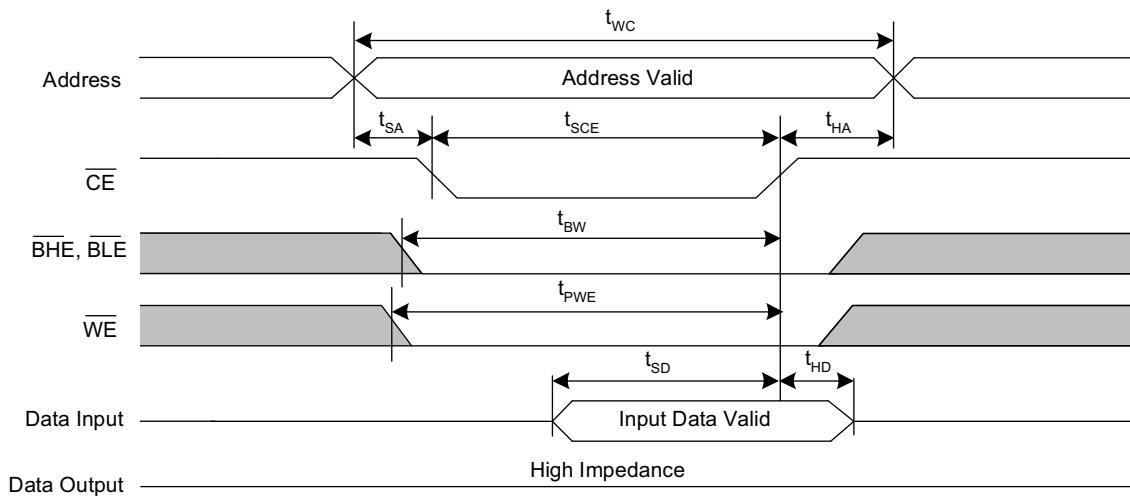

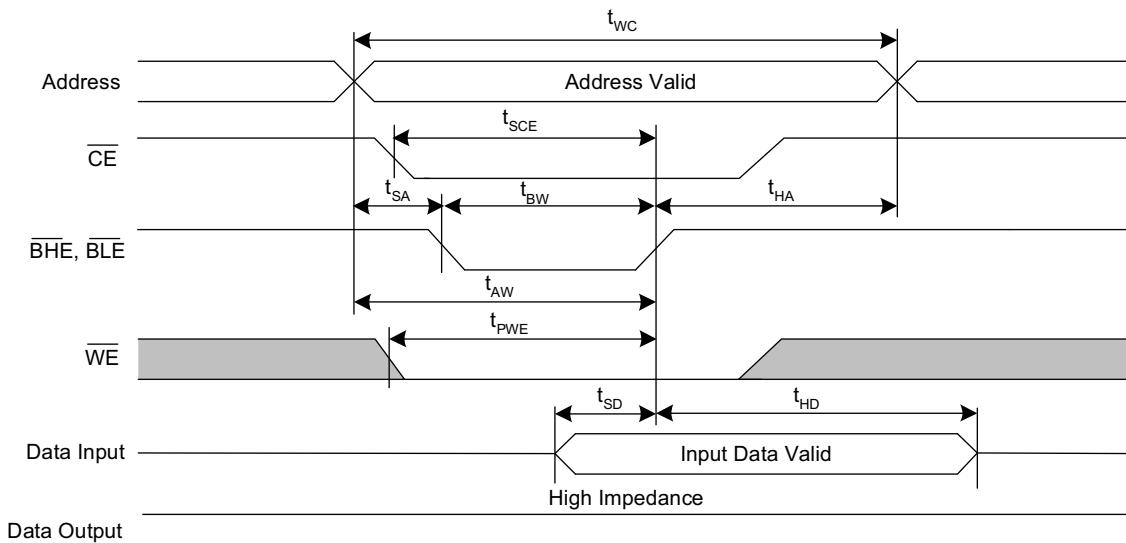

20. Test conditions assume signal transition time of 3 ns or less, timing reference levels of  $V_{CC}/2$ , input pulse levels of 0 to  $V_{CC(ty)}$ , and output loading of the specified  $I_{OL}/I_{OH}$  and load capacitance shown in Figure 5 on page 10.
21. WE must be HIGH during SRAM read cycles.
22. Device is continuously selected with  $\overline{CE}$ ,  $\overline{OE}$  and  $\overline{BHE}$  /  $\overline{BLE}$  LOW.
23. These parameters are guaranteed by design but not tested.
24. Measured  $\pm 200$  mV from steady state output voltage.
25. If WE is LOW when  $\overline{CE}$  goes LOW, the outputs remain in the high impedance state.
26. HSB must remain HIGH during read and write cycles.

**Switching Waveforms** (continued)

**Figure 7. SRAM Read Cycle #2 ( $\overline{\text{CE}}$  and  $\overline{\text{OE}}$  Controlled)** [27, 28, 29]

**Figure 8. SRAM Write Cycle #1 ( $\overline{\text{WE}}$  Controlled)** [27, 29, 30, 31]

**Notes**

27.  $\overline{\text{BHE}}$  and  $\overline{\text{BLE}}$  are applicable for  $\times 16$  configuration only.
28.  $\overline{\text{WE}}$  must be HIGH during SRAM read cycles.
29. HSB must remain HIGH during read and write cycles.
30. If  $\overline{\text{WE}}$  is LOW when  $\overline{\text{CE}}$  goes LOW, the outputs remain in the high impedance state.
31.  $\overline{\text{CE}}$  or  $\overline{\text{WE}}$  must be  $\geq V_{IH}$  during address transitions.

**Switching Waveforms** (continued)

**Figure 9. SRAM Write Cycle #2 (CE Controlled)** [32, 33, 34, 35]

**Figure 10. SRAM Write Cycle #3 (BHE and BLE Controlled)** [32, 33, 34, 35]

**Notes**

32. **BHE** and **BLE** are applicable for  $\times 16$  configuration only.
33. If **WE** is LOW when **CE** goes LOW, the outputs remain in the high impedance state.
34. HSB must remain HIGH during read and write cycles.
35. **CE** or **WE** must be  $\geq V_{IH}$  during address transitions.

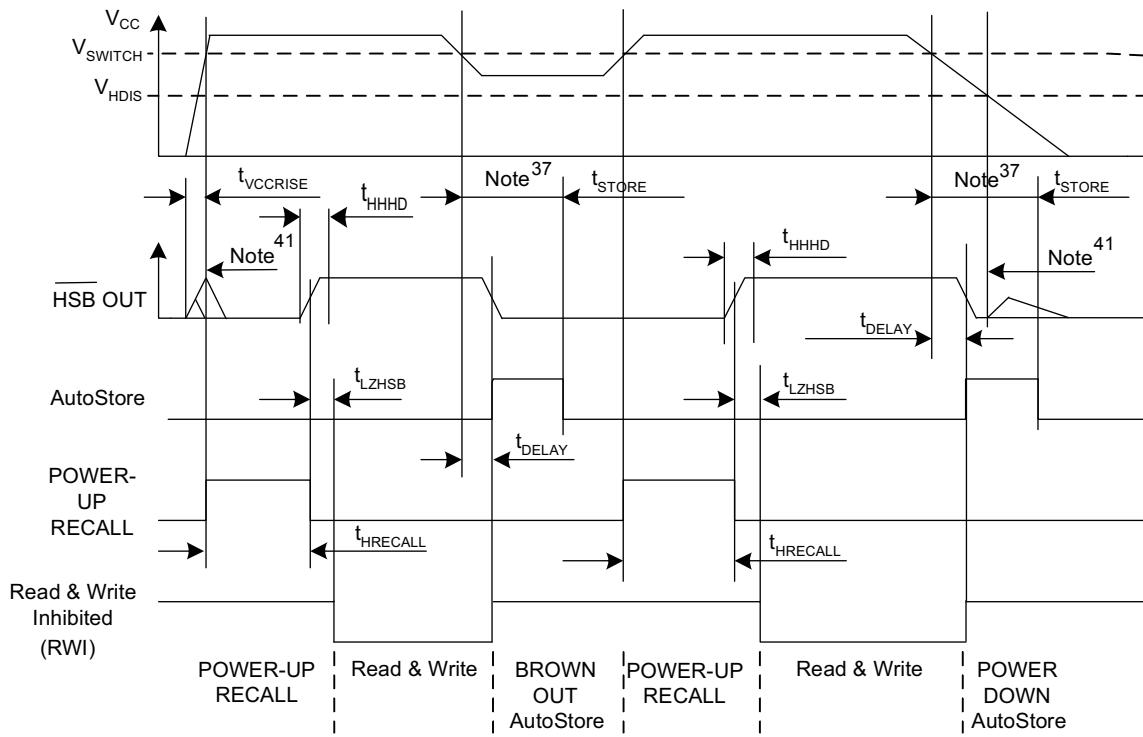

## AutoStore/Power-Up RECALL

Over the Operating Range

Parameter	Description	20 ns		25 ns		45 ns		Unit
		Min	Max	Min	Max	Min	Max	
$t_{HRECALL}$ <sup>[36]</sup>	Power-Up RECALL duration	—	20	—	20	—	20	ms
$t_{STORE}$ <sup>[37]</sup>	STORE cycle duration	—	8	—	8	—	8	ms
$t_{DELAY}$ <sup>[38]</sup>	Time allowed to complete SRAM write cycle	—	20	—	25	—	25	ns
$V_{SWITCH}$	Low voltage trigger level	—	2.65	—	2.65	—	2.65	V
$t_{VCCRISE}$ <sup>[39]</sup>	$V_{CC}$ rise time	150	—	150	—	150	—	$\mu$ s
$V_{HDIS}$ <sup>[39]</sup>	HSB output disable voltage	—	1.9	—	1.9	—	1.9	V
$t_{LZHSB}$ <sup>[39]</sup>	HSB to output active time	—	5	—	5	—	5	$\mu$ s
$t_{HHHD}$ <sup>[39]</sup>	HSB high active time	—	500	—	500	—	500	ns

## Switching Waveforms – AutoStore/Power-up RECALL

Figure 11. AutoStore or Power-Up RECALL<sup>[40]</sup>

### Notes

36.  $t_{HRECALL}$  starts from the time  $V_{CC}$  rises above  $V_{SWITCH}$ .
37. If an SRAM write has not taken place since the last non-volatile cycle, no AutoStore or Hardware STORE takes place.
38. On a Hardware STORE and AutoStore initiation, SRAM write operation continues to be enabled for time  $t_{DELAY}$ .
39. These parameters are guaranteed by design but not tested.
40. Read and write cycles are ignored during STORE, RECALL, and while  $V_{CC}$  is below  $V_{SWITCH}$ .
41. During power-up and power-down, HSB glitches when HSB pin is pulled up through an external resistor.

## Software Controlled STORE/RECALL Cycle

Over the Operating Range

Parameter [42, 43]	Description	20 ns		25 ns		45 ns		Unit
		Min	Max	Min	Max	Min	Max	
$t_{RC}$	STORE/RECALL initiation cycle time	20	—	25	—	45	—	ns
$t_{SA}$	Address setup time	0	—	0	—	0	—	ns
$t_{CW}$	Clock pulse width	15	—	20	—	30	—	ns
$t_{HA}$	Address hold time	0	—	0	—	0	—	ns
$t_{RECALL}$	RECALL duration	—	200	—	200	—	200	$\mu$ s

## Switching Waveforms – Software Controlled STORE/RECALL Cycle

Figure 12. CE and  $\overline{OE}$  Controlled Software STORE/RECALL Cycle [43]

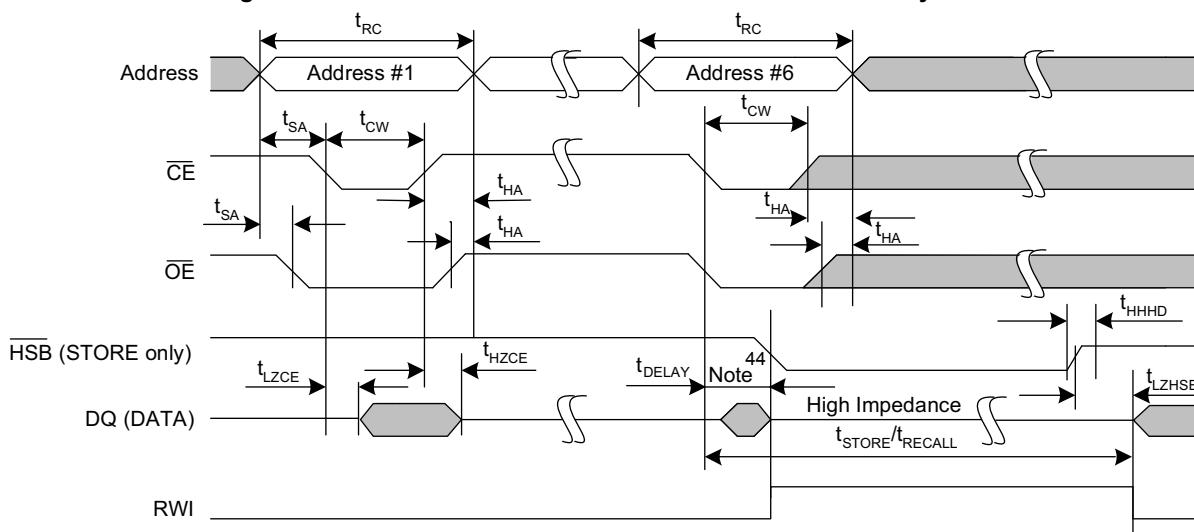

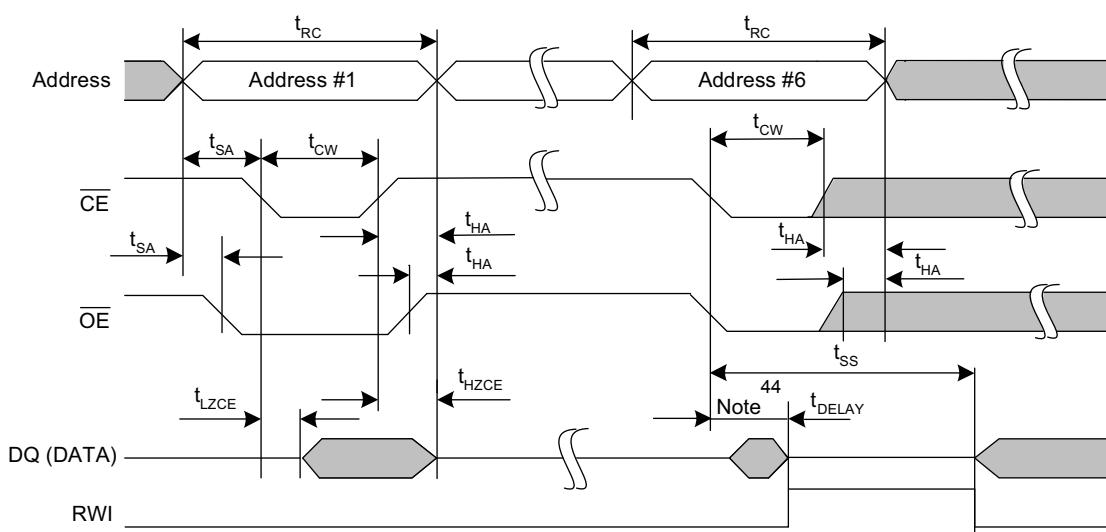

Figure 13. AutoStore Enable/Disable Cycle [43]

### Notes

42. The software sequence is clocked with  $\overline{CE}$  controlled or  $\overline{OE}$  controlled reads.
43. The six consecutive addresses must be read in the order listed in Table 1 on page 6.  $\overline{WE}$  must be HIGH during all six consecutive cycles.
44. DQ output data at the sixth read may be invalid since the output is disabled at  $t_{DELAY}$  time.

## Hardware STORE Cycle

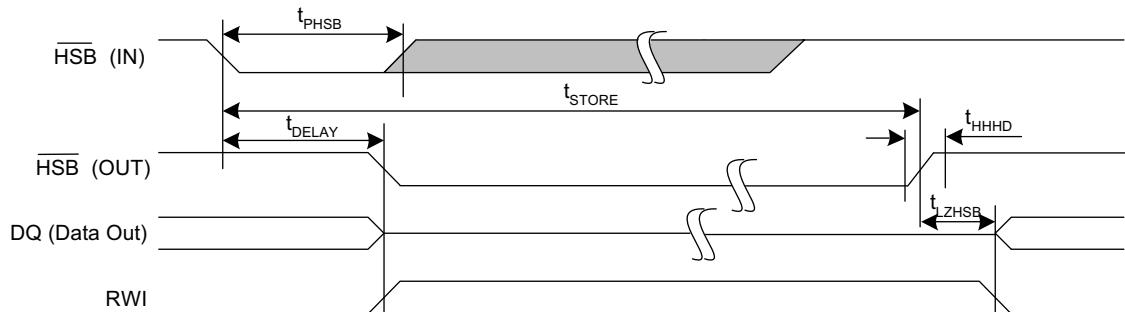

Over the Operating Range

Parameter	Description	20 ns		25 ns		45 ns		Unit
		Min	Max	Min	Max	Min	Max	
$t_{DHSB}$	HSB to output active time when write latch not set	—	20	—	25	—	25	ns
$t_{PHSB}$	Hardware STORE pulse width	15	—	15	—	15	—	ns
$t_{SS}$ <sup>[45, 46]</sup>	Soft sequence processing time	—	100	—	100	—	100	$\mu$ s

## Switching Waveforms – Hardware STORE Cycle

Figure 14. Hardware STORE Cycle<sup>[47]</sup>

Write latch set

Write latch not set

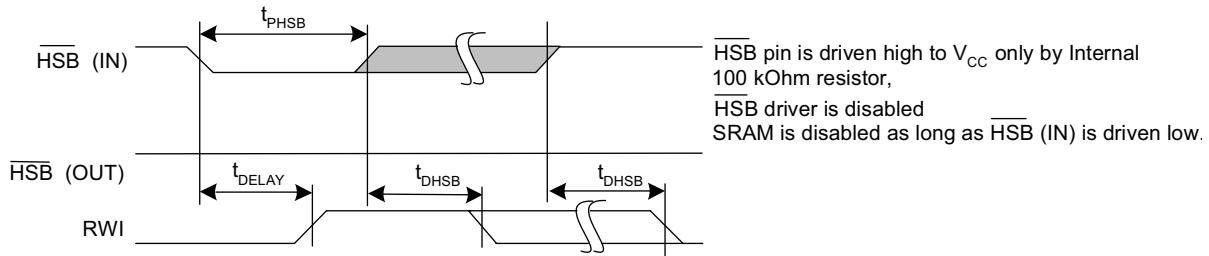

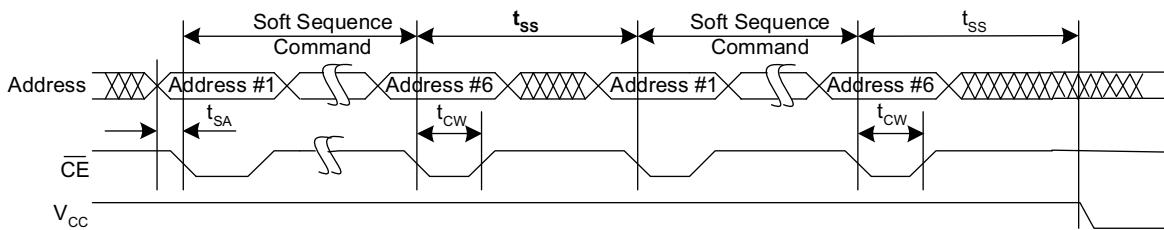

Figure 15. Soft Sequence Processing<sup>[45, 46]</sup>

### Notes

45. This is the amount of time it takes to take action on a soft sequence command.  $V_{CC}$  power must remain HIGH to effectively register command.

46. Commands such as STORE and RECALL lock out I/O until operation is complete which further increases this time. See the specific command.

47. If an SRAM write has not taken place since the last non-volatile cycle, no AutoStore or Hardware STORE takes place.

## Truth Table For SRAM Operations

HSB should remain HIGH for SRAM Operations.

**Table 2. Truth Table for  $\times 8$  Configuration**

<b>CE</b>	<b>WE</b>	<b>OE</b>	<b>Inputs/Outputs<sup>[48]</sup></b>	<b>Mode</b>	<b>Power</b>
H	X	X	High Z	Deselect/Power-down	Standby
L	H	L	Data out (DQ <sub>0</sub> –DQ <sub>7</sub> );	Read	Active
L	H	H	High Z	Output disabled	Active
L	L	X	Data in (DQ <sub>0</sub> –DQ <sub>7</sub> );	Write	Active

**Table 3. Truth Table for  $\times 16$  Configuration**

<b>CE</b>	<b>WE</b>	<b>OE</b>	<b>BHE<sup>[49]</sup></b>	<b>BLE<sup>[49]</sup></b>	<b>Inputs/Outputs<sup>[48]</sup></b>	<b>Mode</b>	<b>Power</b>
H	X	X	X	X	High Z	Deselect/Power-down	Standby
L	X	X	H	H	High Z	Output disabled	Active
L	H	L	L	L	Data out (DQ <sub>0</sub> –DQ <sub>15</sub> )	Read	Active
L	H	L	H	L	Data out (DQ <sub>0</sub> –DQ <sub>7</sub> ); DQ <sub>8</sub> –DQ <sub>15</sub> in High Z	Read	Active
L	H	L	L	H	Data out (DQ <sub>8</sub> –DQ <sub>15</sub> ); DQ <sub>0</sub> –DQ <sub>7</sub> in High Z	Read	Active
L	H	H	L	L	High Z	Output disabled	Active
L	H	H	H	L	High Z	Output disabled	Active
L	H	H	L	H	High Z	Output disabled	Active
L	L	X	L	L	Data in (DQ <sub>0</sub> –DQ <sub>15</sub> )	Write	Active
L	L	X	H	L	Data in (DQ <sub>0</sub> –DQ <sub>7</sub> ); DQ <sub>8</sub> –DQ <sub>15</sub> in High Z	Write	Active
L	L	X	L	H	Data in (DQ <sub>8</sub> –DQ <sub>15</sub> ); DQ <sub>0</sub> –DQ <sub>7</sub> in High Z	Write	Active

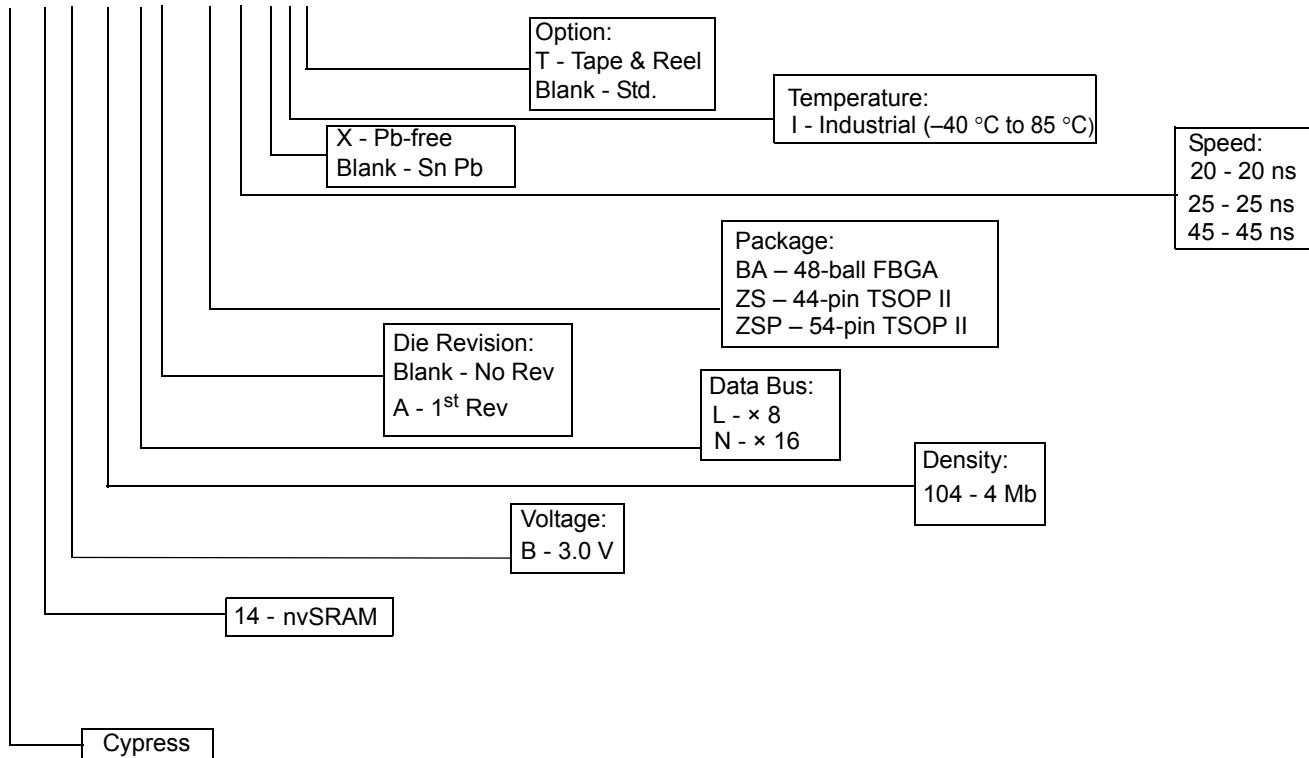

**Notes**

48. Data DQ<sub>0</sub>–DQ<sub>7</sub> for  $\times 8$  configuration and Data DQ<sub>0</sub>–DQ<sub>15</sub> for  $\times 16$  configuration.

49. BHE and BLE are applicable for  $\times 16$  configuration only.

<b>Rev.</b>	<b>ECN</b>	<b>Orig. of Change</b>	<b>Submission Date</b>	<b>Description of Change</b>
**	2606696	GVCH / PYRS	11/13/08	New data sheet.
*A	2672700	GVCH / PYRS	03/12/09	Added best practices Updated <a href="#">Ordering Information</a> (Added CY14B104NA-BA25I). Updated <a href="#">AC Switching Characteristics</a> (Added Note 23 and referred the same note in $t_{LZCE}$ , $t_{HZCE}$ , $t_{LZOE}$ , and $t_{HZOE}$ parameters).
*B	2710274	GVCH / AESA	05/22/09	Moved data sheet status from Preliminary to Final. Updated <a href="#">AutoStore Operation</a> (description (Added Note)). Updated <a href="#">DC Electrical Characteristics</a> (Updated test condition for $I_{SB}$ parameter, updated Note 15). Updated <a href="#">AutoStore/Power-Up RECALL</a> (Added Note 39 and referred the same note in $t_{VCCRISE}$ , $t_{LZHSB}$ and $t_{HHHD}$ parameters, updated description of $V_{HDIS}$ parameter). Updated <a href="#">Switching Waveforms – Software Controlled STORE/RECALL Cycle</a> (Updated Figure 12).
*C	2738586	GVCH	07/15/09	Updated <a href="#">Device Operation</a> (Updated <a href="#">Hardware STORE Operation</a> (description), updated <a href="#">Software STORE</a> (description)). Updated <a href="#">AutoStore/Power-Up RECALL</a> (description of $t_{DELAY}$ parameter, updated Note 38). Updated <a href="#">Switching Waveforms – Software Controlled STORE/RECALL Cycle</a> (Added Note 44 and referred the same note in Figure 12 and Figure 13).
*D	2758397	GVCH / AESA	09/01/09	Updated <a href="#">Features</a> (Removed commercial temperature related information). Updated <a href="#">Operating Range</a> (Removed commercial temperature related information). Updated <a href="#">DC Electrical Characteristics</a> (Removed commercial temperature related information). Updated <a href="#">Ordering Information</a> (Updated part numbers).
*E	2773362	GVCH	10/06/09	Updated <a href="#">Ordering Information</a> (Added 20 ns parts in a 48-ball FBGA package).
*F	2826364	GVCH / PYRS	12/11/09	Updated <a href="#">Features</a> (Changed STORE cycles to QuantumTrap from 200K to 1 Million).
*G	2923475	GVCH / AESA	04/27/2010	Updated <a href="#">Pin Definitions</a> (Added more clarity on $\overline{HSB}$ pin operation). Updated <a href="#">Device Operation</a> (Updated <a href="#">Hardware STORE Operation</a> (added more clarity on HSB pin operation), updated <a href="#">Table 1</a> (added more clarity on BHE/BLE pin operation)). Updated <a href="#">Switching Waveforms – AutoStore/Power-up RECALL</a> ( $\overline{HSB}$ pin operation in Figure 11 and updated Note 41). Updated <a href="#">Package Diagrams</a> Updated <a href="#">Sales, Solutions, and Legal Information</a> .
*H	3132368	GVCH	01/10/2011	Updated <a href="#">Pinouts</a> (Removed the reference of Note 5 in Figure 1). Updated <a href="#">Capacitance</a> (Included input capacitance for BHE, BLE and $\overline{HSB}$ pin, output capacitance for HSB pin). Updated <a href="#">Switching Waveforms – AutoStore/Power-up RECALL</a> (Fixed typo error in Figure 11). Added <a href="#">Acronyms and Units of Measure</a> .
*I	3305495	GVCH	07/07/2011	Updated <a href="#">DC Electrical Characteristics</a> (Added Note 17 and referred the same note in $V_{CAP}$ parameter). Updated <a href="#">AC Switching Characteristics</a> (Added Note 20 and referred the same note in Parameters). Updated <a href="#">Thermal Resistance</a> (Values of $\Theta_{JA}$ for all packages). Updated <a href="#">Package Diagrams</a> .
