### Description

Pericom Semiconductor's PI3VDP411LST provides the ability to use a Dual-mode Display Port transmitter in HDMI mode. This flexibility provides the user a choice of how to connect to their favorite display. All signal paths accept AC coupled video signals. The PI3VDP411LST converts this AC coupled signal into an HDMI rev 1.3 compliant signal with proper signal swing. This conversion is automatic and transparent to the user.

The PI3VDP411LST supports up to 2.5Gbps, which provides 12-bits of color depth per channel, as indicated in HDMI rev 1.3.

### TMDS output oscillation elimination

The inputs do not incorporate a squelch circuit. Therefore, we recommend the input to be externally biased to prevent output oscillation. Pericom recommends to add a 1.5Kohm pull-up to the CLK- input for each of the video input ports.

**Recommended Power Supply Decoupling Circuit**

Figure 1 is the recommended power supply decoupling circuit configuration. It is recommended to put  $0.1\mu\text{F}$  decoupling capacitors on each VDD pins of our part, there are four  $0.1\mu\text{F}$  decoupling capacitors are put in Figure 1 with an assumption of only four VDD pins on our part, if there is more or less VDD pins on our Pericom parts, the number of  $0.1\mu\text{F}$  decoupling capacitors should be adjusted according to the actual number of VDD pins. On top of  $0.1\mu\text{F}$  decoupling capacitors on each VDD pins, it is recommended to put a  $10\mu\text{F}$  decoupling capacitor near our part's VDD, it is for stabilizing the power supply for our part. Ferrite bead is also recommended for isolating the power supply for our part and other power supplies in other parts of the circuit. But, it is optional and depends on the power supply conditions of other circuits.

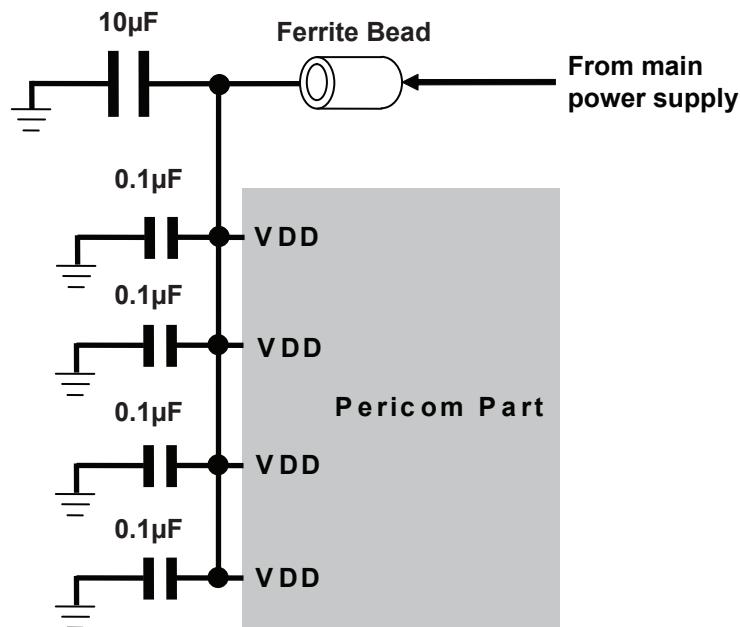

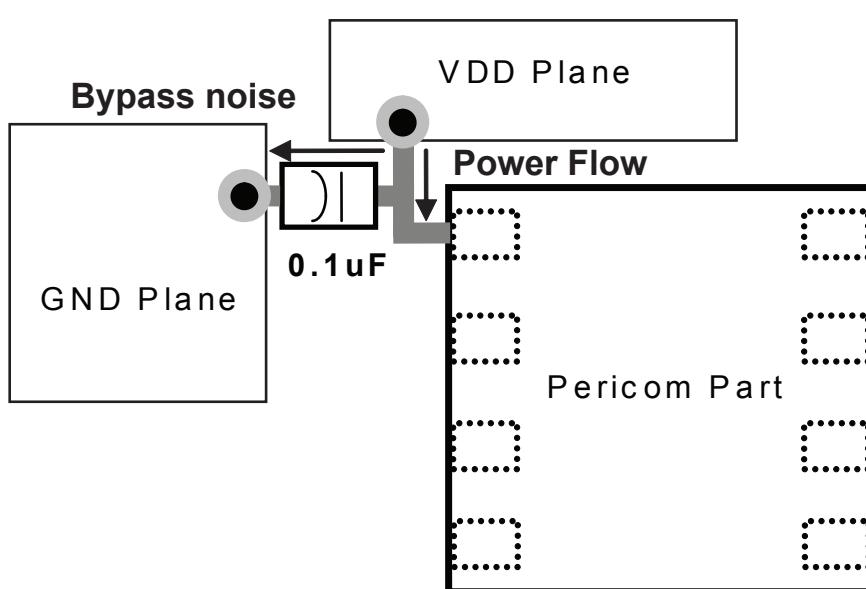

Figure 1 Recommended Power Supply Decoupling Circuit Diagram

## Requirements on the Decoupling Capacitors

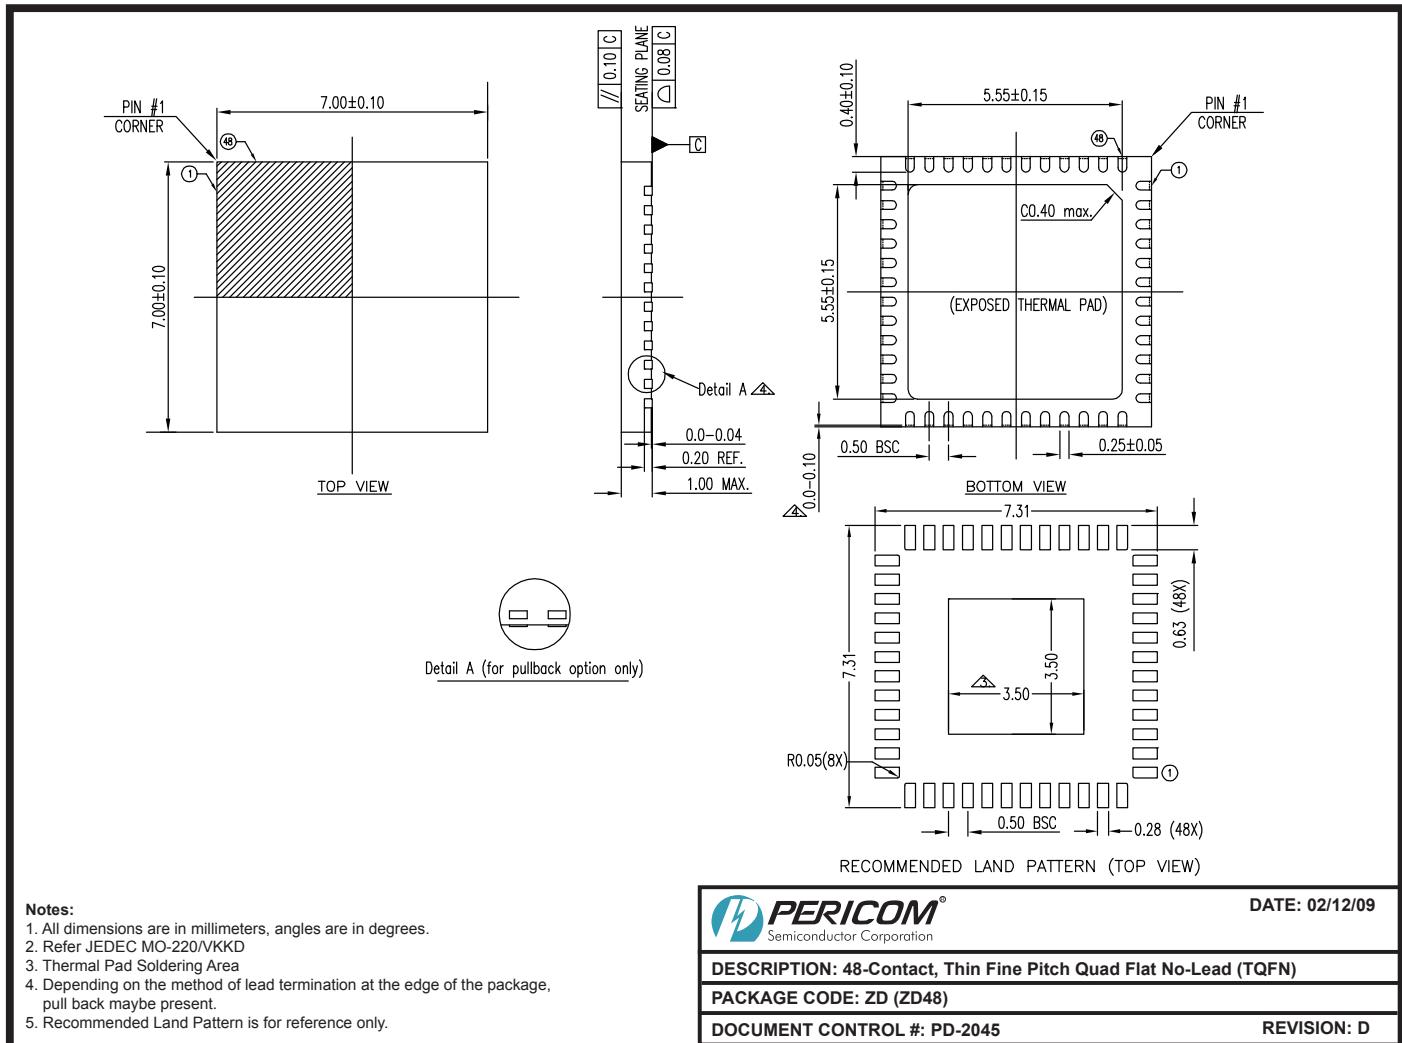

There is no special requirement on the material of the capacitors. Ceramic capacitors are generally being used with typically materials of X5R or X7R.

## Layout and Decoupling Capacitor Placement Consideration

- i. Each  $0.1\mu\text{F}$  decoupling capacitor should be placed as close as possible to each VDD pin.
- ii. VDD and GND planes should be used to provide a low impedance path for power and ground.
- iii. Via holes should be placed to connect to VDD and GND planes directly.
- iv. Trace should be as wide as possible
- v. Trace should be as short as possible.
- vi. The placement of decoupling capacitor and the way of routing trace should consider the power flowing criteria.
- vii.  $10\mu\text{F}$  capacitor should also be placed closed to our part and should be placed in the middle location of  $0.1\mu\text{F}$  capacitors.
- viii. Avoid the large current circuit placed close to our part; especially when it is shared the same VDD and GND planes. Since large current flowing on our VDD or GND planes will generate a potential variation on the VDD or GND of our part.
