## 1 General Description

The ADM8511/X, USB based chip set, provides desktop, notebook and computer peripheral with greater connectivity to ethernet and home network. In the meantime, the ADM8511/X also combines a low power and small package design which is ideal for power and space constrained by the environment. Then, it can reduce the external component BOM cost to a minimum. The ADM8511X is the environmentally friendly “green” package version.

The ADM8511/X device combines a on-chip USB command&EP decoder used for USB interface through SIE (Series Interface Engine), FIFO controller with 24 K SRAM, 64 byte and 2 K byte buffers, 10/100 Mbit/s ethernet physical layer (PHY) and 1M / 10M HomePNA interface 1M8 / 10M8. The 10M HomePNA interface is MII which is the same as the ethernet MAC interface. The ADM8511/X is fully compliant with the IEEE 802.3 u and HomePNA (Home Phoneline Network Alliance) specification revision 1.0.

The ADM8511/X is capable of providing an easy, universal connectivity to computer peripherals with USB. The transfer rate of USB interface is 12 Mbit/s belonging to a high speed USB device. The ADM8511/X supports all USB commands, 4 endpoints and suspend/resume function.

The ADM8511/X's LAN PHY supports 100 Base TX (100 Mbit/s mode) and 10 Base T (10 Mbit/s mode) full-duplex operations. It uses the auto-negotiation function to optimize the network traffic and the built-in 24M SRAM for receiving buffer, especially for 100 Mbit/s. Through FIFO controller, data cannot communicate fluently between buffers and external device. To obtain the better signal quality, the PHY provides wave-shaper, filter and adaptive equalizer to reach. By using diagnostic mechanism (loop-back mode), the data correctness will be increased. The Lan PHY supports external transmit/receive transformer turn ratio 1:1. The ADM8511/X chip set can be programmed MAC analysis and it provides MII interface for external PHY, such as 10M8 interface for 1 Mbit/s HomePNA. In the system application, it is essential that the EEPROM loads device ID and vendor ID automatically. So for ADM8511/X, serial interface is applied for EEPROM communication including read/write function. Furthermore, different system status are reported by some LED pins including transfer speed LEDSP (100 Mbit/s or 10 Mbit/s), Link status (LEDL) on network and transfer type LEDFD/COL) full- duplex or half-duplex or collision on network.

ADM8511/X is ideally suited for USB adapter and intelligent networked peripheral design. By fiber media, ADM8511/X can associate with fiber transceiver & PHY through MII interface to network in fiber network. In HomePAN application, ADM8511/X can provide 1M8 interface and 10M8 (MII interface) associated with external 1M&10M Home PHY for 1 Mbit/s & 10 Mbit/s network. ADM8511/X can't apply only in LAN (Local Area Network) but also in WAN (Wide Area Network), such as xDSL, Cable Modem, and router, etc. In IA (Information Appliance) application, Set-Top box is an example of ADM8511/X application. ADM8511/X also provides serial interface for EEPROM storing default values, e.g. vendor ID, Product ID, etc.(EEPROM Access Program). Specially, ADM8511/X can be tested by test program (MFG) in the less time for mass productions of system board level. This chip provides low power 0.35  $\mu$ m, 3.3 V/5 V I/Otolerance, and 100 pin LQFP package

In software, ADM8511/X provides a fully software support, NDIS 5 driver, Linux driver, EEPROM burn-in program and MFG program. The NDIS 5 and Linux drivers are windows netware drivers. EEPROM burn-in program is convenient for customers to implement. The MFG program is a powerful tool in mass – production.

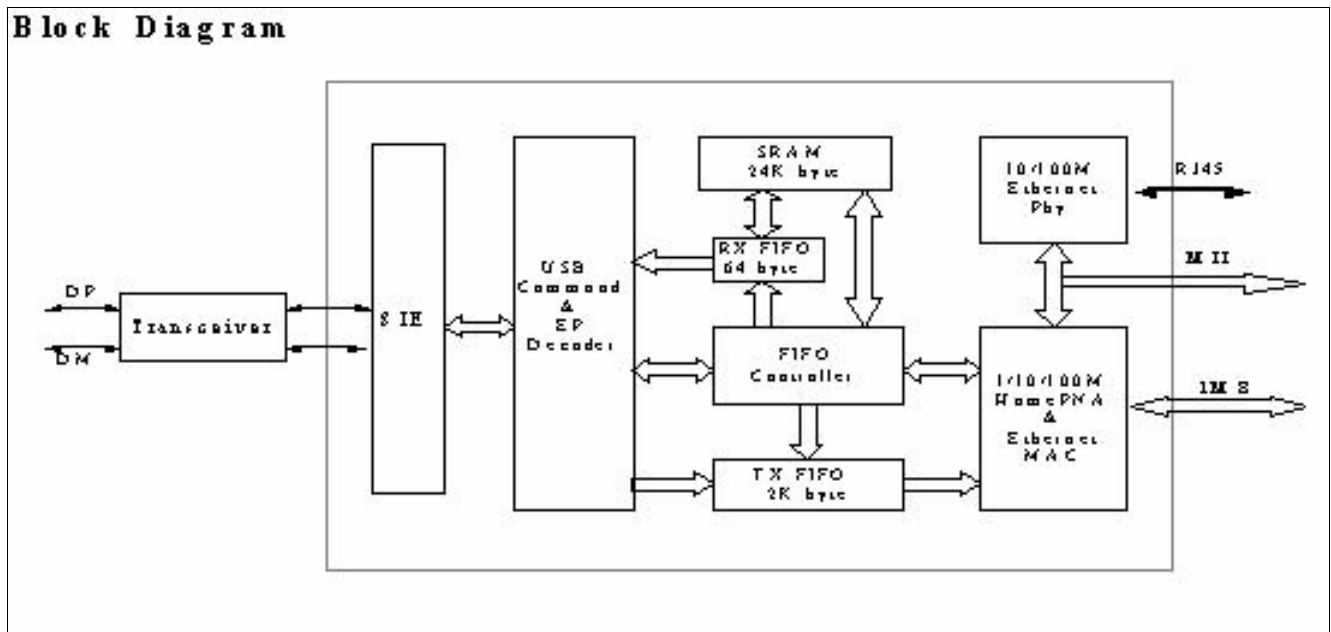

Figure 1 Block Diagram

## 1.1 Package Information

Product Name	Product Type	Package	Ordering Number
ADM8511/X	ADM8511/X-CC-T-1	P-LQFP-100-1	Q67801H 26A101

## 1.2 Features

### 1.2.1 Industry Standard

- IEEE802.3 u 100BASE-TX and IEEE802.3 10BASE-T compliant
- Supports for IEEE 802.3x flow control
- IEEE802.3 u Auto-Negotiation support for 10BASE-T and 100BASE-TX
- USB specification 1.0 and 1.1 compliant

### 1.2.2 USB I/F

- Full-Speed USB Device
- Supports 1 USB configuration and 1 interface
- Supports all USB standard commands
- Supports two vendor specific commands
- Supports USB Suspend/Resume detection logic
- Supports 4 endpoints: 1 control endpoint with maximum 8-byte packet, 1 bulk IN endpoint with maximum 64-byte packet, 1 bulk OUT endpoint with maximum 64-byte packet and 1 interrupt IN endpoint with maximum 8-byte packet

### 1.2.3 MAC/Phy

- Integrates the whole physical layer functions of 100BASE-TX and 10BASE-T by using phy address 1
- Be programmed to isolate the internal PHY, the I/F to external PHY could be either IEEE 802.3 MII (10M8 for HomePNA 2.0). Supports configurable threshold for transmitting PAUSE frame
- Supports wakeup frame, link status change and magic packet wake-up
- Provides full-duplex operation on both 100 Mbit/s and 10 Mbit/s Ethernet modes
- Provides Auto-negotiation (NWAY) function of full/half duplex operation for both 10/100 Mbit/s
- Provides transmit wave-shaper, receive filters, and adaptive equalizer
- Provides MLT-3 transceiver with DC restoration for Base-Line Wander compensation
- Provides MAC and Transceiver loop-back modes for diagnostic
- Supports external transmit transformer with turn ratio 1:1
- Supports external receive transformer with turn ratio 1:1

### 1.2.4 EEPROM I/F

- Provides serial interface for read/write 93C46 EEPROM
- Automatically load device ID, vendor ID from EEPROM after power-on reset

### 1.2.5 FIFO

- Supports internal 2 Kbytes SRAM for transmission
- Supports external 32 Kbytes SRAM or internal 24 Kbytes synchronous SRAM for receiving.
- Supports “receive 32 packets” or “receive 16 packets” queue in the receive buffer

### 1.2.6 LED Display

- Provides LED display
- LEDSP: Speed - 100 Mbit/s(on) or 10 Mbit/s(off)
- LEDL: Link (keeps on when link ok) or Active (will be blinking with 10 Hz)
- LEDFD/COL: FD (keeps on when in Full duplex mode) or Collision (will be blinking with 20 Hz when colliding)

### 1.2.7 Miscellaneous

- Supports 6 GPIO pins
- Provides 100-pin LQFP package
- 3.3 V power supply with 5 V/3.3 V I/O tolerance

### 1.2.8 LAN Driver Support

- Windows Networks: NDIS 5.0
- Linux

### 1.2.9 Utility

- EEPROM burn-in program

- MFG testing program

## 2 Interface Description

### 2.1 Pin Diagram

Figure 2 Pin Diagram

## 2.2 Pin Description

**Table 1 Abbreviations for Pin Type**

Abbreviations	Description
I	Standard input-only pin. Digital levels.
O	Output. Digital levels.
I/O	I/O is a bidirectional input/output signal.
AI	Input. Analog levels.
AO	Output. Analog levels.
AI/O	Input or Output. Analog levels.
PWR	Power
GND	Ground
MCL	Must be connected to Low (JEDEC Standard)
MCH	Must be connected to High (JEDEC Standard)
NU	Not Usable (JEDEC Standard)
NC	Not Connected (JEDEC Standard)

**Table 2 Abbreviations for Buffer Type**

Abbreviations	Description
Z	High impedance
PU1	Pull up, 10 k $\Omega$
PD1	Pull down, 10 k $\Omega$
PD2	Pull down, 20 k $\Omega$
TS	Tristate capability: The corresponding pin has 3 operational states: Low, high and high-impedance.
OD	Open Drain. The corresponding pin has 2 operational states, active low and tristate, and allows multiple devices to share as a wire-OR. An external pull-up is required to sustain the inactive state until another agent drives it, and must be provided by the central resource.
OC	Open Collector
PP	Push-Pull. The corresponding pin has 2 operational states: Active-low and active-high (identical to output with no type attribute).
OD/PP	Open-Drain or Push-Pull. The corresponding pin can be configured either as an output with the OD attribute or as an output with the PP attribute.
ST	Schmitt-Trigger characteristics
TTL	TTL characteristics

## 2.2.1 Host Interface

**Table 3 Host Interface**

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
63	I_CLK48	I		<b>48 MHz Clock Input from Crystal or Oscillator</b>
62	O_CLK48	O		<b>Output for Crystal</b>
26	RST#	I		<b>External Hardware Reset Input</b>
71	DM	I/O		<b>USB Data Minus Pin</b>
70	DP	I/O		<b>USB Data Plus Pin</b>

## 2.2.2 MII Interface

Program ADM8511/X as MAC-only mode, set  $81_H[4:2]=001_B$  and  $01_H$  bit 2 = 0

**Table 4 MII Interface**

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
82	COL	I		<b>Collision Detected</b> This signal is asserted high asynchronously by the external physical unit upon detection of a collision on the medium. It will remain asserted as long as the collision condition persists.
81	CRS	I		<b>Carrier Sense</b> This signal is asserted high asynchronously by the external physical unit upon detection of a non-idle medium.
100	MDC	O		<b>Management Data Clock</b> Clock signal with a maximum rate of 2.5 MHz used to transfer management data for the external PMD on the MDIO pin.
1	MDIO	I/O		<b>Management Data I/O</b> Bi-directional signal used to transfer management information for the external PMD. Requires external 1.5 k $\Omega$ pull-up resistor.
91	RXCLK	I		<b>Receive Clock</b> A continuous clock that is recovered from the incoming data. During 100 Mbit/s operation RXCLK is 25 MHz, during 10 Mbit/s this is 2.5 MHz and during 1 Mbit/s operation this is 0.25 MHz.
95	RXD3	I		<b>Receive Data</b> This is a group of 4 data signals aligned on nibble boundary which are driven synchronous to the RXCLK by the external physical unit. RXD[3] is the most significant bit and RXD[0] is the least significant bit.
96	RXD2			
97	RXD1			
99	RXD0			

## Interface Description

Table 4 MII Interface (cont'd)

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
93	RXDV	I		<b>Receive Data Valid</b> This indicates that the external physical unit is presenting recovered and decoded nibbles on the RXD[3:0] and that RXCLK is synchronous to the recovered data.
90	RXER	I		<b>Receive Error</b> This signal is asserted high synchronously by the external physical unit whenever it detects a media error and RXDV is asserted. If not used, it should be grounded, e.g. isolate internal phy and use external phy. However, if the external phy has RXER pin, the RXER of ADM8511/X should connect to this RXER of the external phy.
89	TXCLK	I		<b>Transmit Clock</b> A continuous clock sourced in the physical layer. During 100 Mbit/s operation this is 25 MHz $\pm$ 100 ppm. During 10 Mbit/s operation this clock is 2.5 MHz $\pm$ 100 ppm. During 1 Mbit/s operation this clock is 0.25 MHz $\pm$ 100 ppm.
83	TXD3	O		<b>Transmit Data</b> This is a group of 4 data signals which are driven synchronously to the TXCLK for transmission to the external physical unit. TXD[3] is the most significant bit and TXD[0] is the least significant bit.
84	TXD2			
85	TXD1			
86	TXD0			
87	TXEN	O		<b>Transmit Enable</b> This signal is synchronous to TXCLK and provides precise framing for data carried on TXD[3:0]. It is asserted when TX[3:0] contains valid data to be transmitted. Requires external pull-down resistor 4.7 k $\Omega$ if external phy is used
3	XLNKSTS	I		<b>Link Status Indication</b> External PHY reports link status information to system and level change trigger. Pull-down to low if external phy is used.

## 2.2.3 1M8 Interface

 Program ADM8511/X as MAC-only mode, set 81<sub>H</sub>[4:2]=001<sub>B</sub> and 01<sub>H</sub> bit 2 = 1

Table 5 1M8 Interface

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
82	HPN_COL	I		<b>Collision</b> Indicates a collision was detected by the 1M8 PHY on the 1M8 wiring network.
81	HPN_CRS	I		<b>Carrier Sense</b> Indicates the 1M8 PHY is receiving a valid 1M8 signal from the wiring network.

## Interface Description

Table 5 1M8 Interface (cont'd)

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
91	HPN_RXCLK	I		<b>Receive Clock</b> Clock for RX_D.
95	HPN_RXD	I		<b>Receive Data</b> Data to the MAC is synchronously clocked by HPN_RXCLK.
93	HPN_RXDV	I		<b>Receive Data Valid</b> This indicates that the external physical unit is presenting recovered and decoded nibbles on the HPN_RXD and that HPN_RXCLK is synchronous to the recovered data.
89	HPN_TXCLK	I		<b>Transmit Clock</b> Clock for HPN_TXD.
86	HPN_TXD	O		<b>Transmit Data</b> Data to the PHY is synchronously clocked by HPN_TXCLK.
87	HPN_TXEN	O		<b>Transmit Enable</b> Transmits enable request from the MAC to begin sending data to the PHY.

## 2.2.4 Physical Interface

Table 6 Physical Interface

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
16	XTLP	I		<b>Crystal inputs</b> To be connected to a 25 MHz crystal.
15	XTLN			
6	RXIN	I		The differential receives inputs of 100Base-TX or 10Base-T, these pins directly input from Magnetic.
7	RXIP			
18	TXOP	O		The differential Transmit outputs of 100Base-TX or 10Base-T, these pins directly output to Magnetic.
19	TXON			
13	RIBB	I		<b>Reference Bias Resistor</b> To be tied to an external 10.0K (1%) resistor which should be connected to the analog ground at the other end.
9	TST0	I		<b>Test pin</b>
10	TST1			
11	TST2			
5	TST3			

## 2.2.5 LED Display

**Table 7 LED Display**

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
22	LEDSP	O		<b>LED Display for 100 Mbit/s or 10 Mbit/s Speed</b> Active low indicates 100Base-TX, active high indicates 10 BaseT.
23	LEDL	O		<b>LED Display for Link and Activity Status</b> Active low when link is established.
24	LEDFD/COL	O		<b>LED Display for Full Duplex or Collision Status</b> Active low indicates full duplex, high indicates collision in half duplex.

## 2.2.6 SRAM Interface

**Table 8 SRAM Interface**

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
48	SRAM_A14	O		<b>External SRAM Address Bus</b>
50	SRAM_A13

46	SRAM_D6			
45	SRAM_D5			
44	SRAM_D4			
42	SRAM_D3			
41	SRAM_D2			
39	SRAM_D1			
38	SRAM_D0			

**Table 8 SRAM Interface (cont'd)**

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
36	SRAM_CE#	O		<b>External SRAM Chip Enable</b>
34	SRAM_OE#	O		<b>External SRAM Output Enable</b>
27	SRAM_WE#	O		<b>External SRAM Write Enable</b>

### 2.2.7 EEPROM Interface

**Table 9 EEPROM Interface**

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
67	EECS	O		<b>EEPROM Chip Select</b> This enables the EEPROM during loading of the Ethernet configuration data.
65	EEDI	O		<b>EEPROM Data In</b> The MAC will use this pin to serially write opcodes, addresses and data into the serial EEPROM.
64	EEDO	I		<b>EEPROM Data Out</b> The MAC will read the contents of the EEPROM serially through this pin.
66	EESK	O		<b>EEPROM Clock</b> After reset, the MAC if configured, will read the contents of the EEPROM using EESK, EEDO, and EEDI. This pin provides the clock for the EEPROM.

### 2.2.8 Miscellaneous

**Table 10 Miscellaneous**

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
80	GPIO5	I/O		These pins are used as general purpose Input/Output pins and offset 0A[1] = 0 in EEPROM. Default is internal pull-low
78	GPIO4			
77	GPIO3			
76	GPIO2			
75	GPIO1			
74	GPIO0			
2	POREN_N	I		<b>Internal Power On Reset Logic Enable</b> Default is enabled and internal pull - low. When external hardware reset is used, this pin should be connected to $V_{cc}$ via 4.7 k $\Omega$ resistor.

## 2.2.9 Power Pins

**Table 11 Power Pins**

Pin or Ball No.	Name	Pin Type	Buffer Type	Function
21, 37, 52, 68, 98	PVDI	P		3.3 V Power Supply for Core
31, 49, 88	PVDE	P		3.3 V Power Supply for Pads
25, 40, 61, 73, 94	PV0I	P		Ground for PVDI
29, 43, 56, 79, 92	PV0E	P		Ground for PVDE
69	UVDD	P		3.3 V Power Supply for USB Transceiver
72	UVSS	P		Ground for UVDD
4	VAAR	P	P	Analog Power Pins, 3.3 V
14	VAAREF			
20	VAAT			
8	GNDR	P		Analog Ground Pins
12	GNDREF			
17	GNDT			

## 3 Function Description

### 3.1 USB Interface

USB is a likely solution when you want to use a computer to communicate with devices outside the computer. The interface is suitable for one-of-kind and small-scale designs as well as mass-produced and standard peripheral. The benefits to USB are easy to use, fast and reliable data transfers, flexibility, low cost and power conservation.

#### 3.1.1 SIE

SIE (Serial Interface Engine) is used to control USB communications and check USB protocol, and then transfer protocol to EP decoder. The SIE and USB transceivers, which provide the hardware interface to the USB cable, together comprise the USB engine

#### 3.1.2 USB Command & EP Decoder

The detail description is in Appendix 4.

### 3.2 MAC Interface

#### 3.2.1 MII

The Media Independent Interface (MII) is an 18 wire MAC/Phy interface described in 802.3 u. The purpose of the interface is to allow MAC layer devices to attach to a variety of Physical Layer devices through a common interface. MII operates at either 100 Mbit/s or 10 Mbit/s, dependant on the speed of the Physical Layer. With clocks running at either 25 MHz or 2.5 MHz, 4 bit data is clocked between the MAC and Phy, synchronous with Enable and Error signals.

On receipt of valid data from the wire interface, RX\_DV will go active signaling to the MAC that the valid data will be presented on the RXD[3:0] pins at the speed of the RX\_CLK.

On transmission of data from the MAC, TX\_EN is presented to the phy indicating the presence of valid data on TXD[3:0]. TXD[3:0] are sampled by the phy synchronous to TX\_CLK during the time that TX\_EN is valid.

#### 3.2.2 Adaptive Equalizer

The amplitude and phase distortions from cable cause inter-symbol interference (ISI) which makes clock and data recovery difficult. The adaptive equalizer is designed to closely match the inverse transfer function of the twisted-pairs cable. The equalizer has the ability to change its equalizer frequency response according to the cable length. The equalizer will tune itself automatically to any cable, compensating for the amplitude and phase distortion introduced by the cable.

#### 3.2.3 LEDs

Individual LED output is available to indicate Speed, Duplex, Collision, Transmit, and Link. These multi-function pins are inputs during reset and LED output pins thereafter. The level of these pins during reset determines their active output states. If a multi-function pin is pulled up during reset to select a particular function, the LED output would become active low, and the LED circuit must be designed accordingly, and vice versa.

### 3.2.4 Jabber and SQE

After the MAC transmitter exceeds the jabber timer, the transmit and loopback functions will be disabled and COL signal gets asserted. After TX\_EN goes low for more than 500 ms, the TP transmitter will reactivate and COL gets de-asserted. Setting Jabber Disable will disable the jabber function.

When the SQE test is enabled, a COL pulse is asserted after each transmitted packet. SQE is enabled in 10Base-T by default.

### 3.2.5 Auto Polarity

Certain cable plants have crossed wiring on the twisted pairs; the reversal of TXIN and TXIP. Under normal circumstances this would cause the receive circuitry to reject all data. When the Auto Polarity Disable bit is cleared, the Phy is able to detect the fact that either 8 NLPs (normal link pulse) or a burst of FLPs are inverted and automatically reverses the receiver's polarity. The polarity state is stored in the Reverse Polarity bit.

### 3.2.6 Auto-Negotiation

It provides a linked device with the capability to detect the abilities (modes of operation) supported by the device at the other end of the link, determines common abilities, and configures joint operations. Auto-Negotiation is performed out-of-band using a pulse code sequence that is compatible with the 10Base-T link integrity test sequence.

### 3.2.7 Baseline Wander Compensation

The 100BASE-TX data stream is not always DC balanced. The transformer blocks the DC components of the incoming signal, thus the DC offset of the differential receive inputs can drift. The shifting of the signal level, coupled with non-zero rise, and fall times of the serial stream, can cause pulse-width distortion. This creates jitter and possibly increases in the bit error rates. Therefore, a DC restoration circuit is needed to compensate the attenuation of the DC component. Unlike the traditional implementation, the circuit does not need the feedback information from the slicer or the clock recovery circuit. The design simplifies the circuit design. In 10Base-T, the baseline wander correction circuit is not required.

## 3.3 FIFO Controller

FIFO Controller in receive path is in charge of:

- Store received Ethernet packets to SRAM (internal 24 Kbyte or external 32 Kbyte) and total 32 (or 16) packets can be stored to SRAM. If more than maximum packet counts are received or total packet size is more than 32 K (or 24 K for internal SRAM) bytes, the subsequent coming Ethernet packet will be discarded.
- FIFO controller will load data from SRAM to internal RX FIFO then inform EP Decoder that 64-byte data or a packet is ready in RX FIFO. Before FIFO controller informs this, any USB access to bulk IN endpoint will return NAK. To maintain the data transfer on USB bus via bulk IN transfer must be continuously, thus a 64-byte internal RX FIFO is needed.
- If an Ethernet packet is being received and loading into SRAM while FIFO Controller is moving data from SRAM to internal RX FIFO, writing the Ethernet packet to SRAM will get the higher priority.

FIFO Controller in transmit path is in charge of:

- Store each individual USB packet to internal TX FIFO. When EP decoder informs end of packet, a complete Ethernet packet is stored in TX FIFO. FIFO Controller then informs MAC to transmit this packet.
- Total 4 Ethernet packets can be stored in TX FIFO. If all 4 Ethernet packets are stored in TX FIFO or total packet size is more than 2 K bytes, FIFO Controller will inform EP Decoder that TX FIFO is full and EP Decoder will return NAK if accessing bulk OUT endpoint is invoked. Thus additional USB packet won't be written into TX FIFO until TX FIFO has free space.

### 3.4 TX FIFO and RX FIFO

RX FIFO is a one-port 64-byte FIFO and TX FIFO is a two-port 2 Kbyte FIFO.

### 3.5 1/10/100 Ethernet/HomePNA MAC

The MAC controller takes in charge of:

- Generate CRC then transmit Ethernet packet.
- Check CRC for received packet CRC, filter the received packets.
- Polling PHY status.
- Magic packet detection.
- Automatically transmit PAUSE frame when received status meets the flow control criteria.
- Late collision transmit packets will be discarded.

### 3.6 10/100M Ethernet PHY

The internal Ethernet PHY is compliant to IEEE 802.3u 100Base-TX and IEEE802.3 10Base-T. It provides the whole physical layer functions for both 10M and 100M Ethernet speed. The internal PHY can be isolated by programming register offset 7B<sub>H</sub>, bit 1.

## **4        Registers Description**

System Registers and Transceiver Registers.

The register is addressed wordwise.

Table 14 Registers Access Types

Mode	Symbol	Description Hardware (HW)	Description Software (SW)
read/write	rw	Register is used as input for the HW	Register is read and writable by SW
read	r	Register is written by HW (register between input and output -> one cycle delay)	Value written by software is ignored by hardware; that is, software may write any value to this field without affecting hardware behavior (= Target for development.)
write	w		Register is writable by SW
read/write hardware affected	rwh	Register can be modified by HW	Register can be modified by HW, but the priority SW versus HW has to be specified
	rww		
Read only	ro	Register is set by HW (register between input and output -> one cycle delay)	SW can only read this register
Read virtual	rv	Physically, there is no new register, the input of the signal is connected directly to the address multiplexer.	SW can only read this register
Latch high, self clearing	lhsc	Latch high signal at high level, clear on read	SW can read the register
Latch low, self clearing	llsc	Latch high signal at low-level, clear on read	SW can read the register
Latch high, mask clearing	lhmk	Latch high signal at high level, register cleared with written mask	SW can read the register, with write mask the register can be cleared (1 clears)
Latch low, mask clearing	llmk	Latch high signal at low-level, register cleared on read	SW can read the register, with write mask the register can be cleared (1 clears)
Interrupt high, self clearing	ihsc	Differentiates the input signal (low->high) register cleared on read	SW can read the register
Interrupt low, self clearing	ilsc	Differentiates the input signal (high->low) register cleared on read	SW can read the register
Interrupt high, mask clearing	ihmk	Differentiates the input signal (high->low) register cleared with written mask	SW can read the register, with write mask the register can be cleared

## Registers Description System Registers

Table 14 Registers Access Types (cont'd)

Mode	Symbol	Description Hardware (HW)	Description Software (SW)
Interrupt low, mask clearing	ilmk	Differentiates the input signal (low->high) register cleared with written mask	SW can read the register, with write mask the register can be cleared
Interrupt enable register	ien	Enables the interrupt source for interrupt generation	SW can read and write this register
latch_on_reset	lor	rw register, value is latched after first clock cycle after reset	Register is readable and writable by SW
Read/write self clearing	rwsc	Register is used as input for the hw, the register will be cleared due to a HW mechanism.	Writing to the register generates a strobe signal for the HW (1 pdi clock cycle) Register is readable and writable by SW.

Table 15 Registers Clock Domains

Clock Short Name	Description

## 4.1.1

## Ethernet Control 0

**EC0** **Offset**  
**Ethernet Control 0** **00<sub>H</sub>** **Reset Value**  
**09<sub>H</sub>**

7	6	5	4	3	2	1	0

rw	rw	rw	rw	rw	rw	rw	rw

Field	Bits	Type	Description
TXE	7	rw	<b>Enable Ethernet Transmission</b> tx_en
RXE	6		<b>Enable Ethernet Receive</b> rx_en
RXFCE	5		<b>Enable Receive Pause Frame</b> rx_flowctl_en
WOE	4		<b>Enable Wake-On-LAN Mode</b> wakeon_en
RXSA	3		<b>Enable Status Append at the End of Received Packet</b> rxstatus_append

## Registers Description System Registers

Field	Bits	Type	Description
SBO	2	rw	<b>Stop Back Off</b> $0_B$ , back-off counter isn't affected by carrier. $1_B$ , back-off counter stops when carrier is active and resumes when carrier is dropped.
RXMA	1		<b>Receive All Multicast Packet</b> rx_multicast_all
RXCS	0		<b>Include CRC in Receive Packet</b> rx_crc_sent

## Ethernet Control 1

**EC1** **Offset** **Reset Value**  
 Ethernet Control 1 **01<sub>H</sub>** **00<sub>H</sub>**

7	6	5	4	3	2	1	0
Res	DH	FD	10M	RM	HM	Res	
ro	rw	rw	rw	rw	rw	ro	

Field	Bits	Type	Description
Res	7	ro	<b>Reserved</b>
DH	6	rw	<b>Delay Home</b> $0_B$ , all data is received after HPN_CRS asserts $1_B$ , 1 bit data is dropped after HPN_CRS asserts
FD	5		<b>Full Duplex</b> $0_B$ , half-duplex mode $1_B$ , full-duplex mode
10M	4		<b>10Mode</b> $0_B$ , 10Base-T mode $1_B$ , 100Base-T mode
RM	3		<b>Reset MAC</b> Reset MAC, After write 1, HW will clear this bit after MAC resets.
HM	2		<b>Homelan Mode</b> $0_B$ , MII I/F to external PHY $1_B$ , 1M8 I/F to external PHY
Res	1:0		ro

## Ethernet Control 2

**EC2** **Offset** **Reset Value**  
**Ethernet Control 2** **02<sub>H</sub>** **00<sub>H</sub>**

7	6	5	4	3	2	1	0
Res	LES	EWED	LB	PR	RBP	E3RC	
ro	rw	rw	rw	rw	rw	rw	rw

Field	Bits	Type	Description
Res	7:6	ro	<b>Reserved</b>
LES	5	rw	<b>Load EEPROM Start</b> When this bit is written with 1, HW will start to load EEPROM.
EWED	4		<b>EEPROM Write Enable/Disable</b> 0 <sub>B</sub> , EEPROM writes enable/disable command 1 <sub>B</sub> , EEPROM writes command
LB	3		<b>Loop Back</b> Enables MAC in a loop back mode
PR	2		<b>Promiscuous</b> 0 <sub>B</sub> , receives packets which pass the address filter 1 <sub>B</sub> , receives any packet
RBP	1		rx_bad_pkt 0 <sub>B</sub> , filters all bad packets 1 <sub>B</sub> , receives bad packets which pass the address filter
E3RC	0		Ep3_rd_clr/ 0 <sub>B</sub> , Access EP3, no effect to those registers. 1 <sub>B</sub> , Once EP3 is accessed those registers (2B-2F, 7A) will be cleared.

## Registers Description System Registers

**Ethernet ID 0**

**EID0** **Offset** **Reset Value**  
**Ethernet ID 0** **10<sub>H</sub>** **00<sub>H</sub>**

Field	Bits	Type	Description
EID0	7:0	rw	<b>Ethernet ID 0</b> The 1st byte of ethernet ID is automatically loaded from EEPROM after HW reset.

**Ethernet ID 1**

<b>EID1</b>	<b>Offset</b>	<b>Reset Value</b>
Ethernet ID 1	11 <sub>H</sub>	00 <sub>H</sub>

Field	Bits	Type	Description
EID1	7:0	rw	<b>Ethernet ID 1</b> The 2nd byte of ethernet ID.

**Ethernet ID 2**

<b>EID2</b>	<b>Offset</b>	<b>Reset Value</b>
Ethernet ID 2	12 <sub>H</sub>	00 <sub>H</sub>

Field	Bits	Type	Description
EID2	7:0	rw	<b>Ethernet ID 2</b> The 3rd byte of ethernet ID.

**Ethernet ID 3**

<b>EID3</b>	<b>Offset</b>	<b>Reset Value</b>
Ethernet ID 3	13 <sub>H</sub>	00 <sub>H</sub>

Field	Bits	Type	Description
EID3	7:0	rw	<b>Ethernet ID 3</b> The 4th byte of ethernet ID.

**Ethernet ID 4**

<b>EID4</b>	<b>Offset</b>	<b>Reset Value</b>
Ethernet ID 4	14 <sub>H</sub>	00 <sub>H</sub>

Field	Bits	Type	Description
EID4	7:0	rw	<b>Ethernet ID 4</b> The 5th byte of ethernet ID.

## Ethernet ID 5

<b>EID5</b>	<b>Offset</b>	<b>Reset Value</b>
Ethernet ID 5	15 <sub>H</sub>	00 <sub>H</sub>

Field	Bits	Type	Description
EID5	7:0	rw	<b>Ethernet ID 5</b> The 6th byte of ethernet ID.

## Reserved 5

**Receive Packet Number Based Flow Control**

**RPNBFC** **Offset**  
**Receive Packet Number Based Flow Control** **1A<sub>H</sub>** **Reset Value**  
**00<sub>H</sub>**

Field	Bits	Type	Description
Res	7	ro	<b>Reserved</b>
PN	6:1	rw	<b>Packet Number</b> This field specifies the threshold for transmitting the PAUSE frame. As the received packet number is more than or equal to this field, the PAUSE frame is sent automatically by HW.
FP	0	rw	<b>Flow Control Packet</b> Enabled pause frame transmission bases on received packet number.

**Occupied Receive FIFO Based Flow Control**

**ORFBFC** **Offset**  
**Occupied Receive FIFO Based Flow Control** **1B<sub>H</sub>** **Reset Value**  
**00<sub>H</sub>**

Field	Bits	Type	Description
Res	7	ro	<b>Reserved</b>
RXS	6:1	rw	<b>RX Size</b> This field specifies the Kbyte threshold for transmitting the PAUSE frame. As the received FIFO is occupied than or equal to this field, the PAUSE frame is sent automatically by HW. If this field =2, as receive FIFO is occupied more than or equal to 2 Kbyte, the PAUSE frame is transmitted.
FRXS	0		<b>Flow Control RX Size</b> Enabled pause frame transmission bases on occupied receive FIFO size.

**EP1 Control**

## Registers Description System Registers

**EP1C** **Offset** **Reset Value**  
**EP1 Control** **1C<sub>H</sub>** **00<sub>H</sub>**

Field	Bits	Type	Description
EPSE	7	rw	<b>EP1 Send0 Enable</b> 0 <sub>B</sub> , Disables EP1 send 1-byte 00 function 1 <sub>B</sub> , Enables EP1 send 1-byte 00 when more than frame_interval's NAK is received
TIA	6:5	rw	<b>Test Interval A</b> This value is used for internal test mode.
TIB	4:0	rw	<b>Test Interval B</b> This value is used for internal test mode.

**RX FIFO Control**

**RXFC** **Offset** **Reset Value**  
**RX FIFO Control** **1D<sub>H</sub>** **00<sub>H</sub>**

Field	Bits	Type	Description
Res	7:2	ro	<b>Reserved</b>
ESE	1	rw	<b>External SRAM Enable</b> 0 <sub>B</sub> , Supports internal 24 Kbyte SRAM 1 <sub>B</sub> , Supports external 32 Kbyte SRAM
R32P	0		<b>Receive 32 Packets</b> 0 <sub>B</sub> , Supports maximum 16 packets in receive FIFO 1 <sub>B</sub> , Supports maximum 32 packets in receive FIFO

**BIST Control**

**BISTC** **Offset** **Reset Value**  
**BIST Control** **1E<sub>H</sub>** **01<sub>H</sub>**

## Registers Description System Registers

Field	Bits	Type	Description
Res	7:3	ro	<b>Reserved</b>
BR	2	r	<b>BIST Result</b> This bit indicates the bist result and is valid when “bist_test_done” is ‘1’. This bit also reflects the value of “pass_or_fail” signal in BIST module. 0 <sub>B</sub> , Fail 1 <sub>B</sub> , Pass
BTD	1	r	<b>BIST Test Done</b> This bit indicates the completion of bist. The bist completes if this bit is ‘1’. This bit also reflects the value of “test_done” signal in BIST module.
BEN	0	rw	<b>BIST Enable</b> This bit enables the BIST function and also drives the “reset” signal in BIST module. 0 <sub>B</sub> , Enable BIST function 1 <sub>B</sub> , Disable BIST function

**Reserved 8**

<b>Res8</b>	<b>Offset</b>	<b>Reset Value</b>

The register is addressed wordwise.

## Registers Description Transceiver Registers

Table 25 Registers Access Types

Mode	Symbol	Description Hardware (HW)	Description Software (SW)
read/write	rw	Register is used as input for the HW	Register is read and writable by SW
read	r	Register is written by HW (register between input and output -> one cycle delay)	Value written by software is ignored by hardware; that is, software may write any value to this field without affecting hardware behavior (= Target for development.)
write	w		Register is writable by SW
read/write hardware affected	rwh	Register can be modified by HW	Register can be modified by HW, but the priority SW versus HW has to be specified
	rwv		
Read only	ro	Register is set by HW (register between input and output -> one cycle delay)	SW can only read this register
Read virtual	rv	Physically, there is no new register, the input of the signal is connected directly to the address multiplexer.	SW can only read this register
Latch high, self clearing	lhsc	Latch high signal at high level, clear on read	SW can read the register
Latch low, self clearing	llsc	Latch high signal at low-level, clear on read	SW can read the register
Latch high, mask clearing	lhmk	Latch high signal at high level, register cleared with written mask	SW can read the register, with write mask the register can be cleared (1 clears)
Latch low, mask clearing	llmk	Latch high signal at low-level, register cleared on read	SW can read the register, with write mask the register can be cleared (1 clears)
Interrupt high, self clearing	ihsc	Differentiate the input signal (low->high) register cleared on read	SW can read the register
Interrupt low, self clearing	ilsc	Differentiate the input signal (high->low) register cleared on read	SW can read the register
Interrupt high, mask clearing	ihmk	Differentiate the input signal (high->low) register cleared with written mask	SW can read the register, with write mask the register can be cleared
Interrupt low, mask clearing	ilmk	Differentiate the input signal (low->high) register cleared with written mask	SW can read the register, with write mask the register can be cleared
Interrupt enable register	ien	Enables the interrupt source for interrupt generation	SW can read and write this register
latch_on_reset	lor	rw register, value is latched after first clock cycle after reset	Register is readable and writable by SW
Read/write self clearing	rwsc	Register is used as input for the hw, the register will be cleared due to a HW mechanism.	Writing to the register generates a strobe signal for the HW (1 pdi clock cycle) Register is readable and writable by SW.

Table 26 Registers Clock Domains

Clock Short Name	Description

## 4.2.1

## Control

**CTL** **Offset** **Reset Value**  
**Control** **00<sub>H</sub>** **1000<sub>H</sub>**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>RE</b>	<b>LB</b>	<b>SS</b>	<b>ANE</b>	<b>PD</b>	<b>IS</b>	<b>RAN</b>	<b>DM</b>	<b>CT</b>	Res						
rwsc	rw	rw	rw	rw	rw	rwsc	rw	rw	rw						

Field	Bits	Type	Description
RE	15	rwsc	<b>Reset</b> This bit is self-clearing. 1 <sub>B</sub> , PHY reset
LB	14	rw	<b>Loopback</b> 0 <sub>B</sub> , Normal operation 1 <sub>B</sub> , Enables loopback mode. This will loopback TXD to RXD, thus it will ignore all the activity on the cable media.
SS	13		<b>Speed Select</b> This bit will be ignored if Auto Negotiation is enabled (0.12=1). 0 <sub>B</sub> , 10 Mbit/s 1 <sub>B</sub> , 100 Mbit/s
ANE	12		<b>Auto-Neg. Enable</b> 0 <sub>B</sub> , Disables auto-negotiate process 1 <sub>B</sub> , Enables auto-negotiate process (overrides 0.13 and 0.8)
PD	11		<b>Power Down</b> 0 <sub>B</sub> , Normal operation 1 <sub>B</sub> , Power down. ADM 8511 will shut off all blocks except for MDIO/MDC interface
IS	10		<b>Isolate</b> 0 <sub>B</sub> , Normal operation 1 <sub>B</sub> , Electrically isolate the PHY from MII. However, PHY is still able to response to MDC/MDIO
RAN	9	rwsc	<b>Restart Auto-Negotiation</b> 0 <sub>B</sub> , Normal operation 1 <sub>B</sub> , Restart Auto-Negotiation process

## Registers Description Transceiver Registers

Field	Bits	Type	Description
DM	8	rw	<b>Dublex Mode</b> 0 <sub>B</sub> , Half duplex 1 <sub>B</sub> , Full duplex
CT	7		<b>Collision Test</b> 0 <sub>B</sub> , Disables COL test 1 <sub>B</sub> , Enables collision test, which issues the COL signal in response to the assertion of TX_EN signal
Res	6:0		<b>Reserved</b>

## Status

STA Status	Offset	Reset Value

## 5 Electrical Characteristics

### 5.1 Absolute Maximum Ratings

**Table 28 Absolute Maximum Ratings**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Supply Voltage	$V_{DD}$	–	–	4.6	V	–
DC Input Voltage	$V_{IN}$	–	–	6	V	–
DC Output Voltage	$V_{OUT}$	–	–	4.6	V	–
Power Consumption	$I_{PC}$	–	–	64	mA	Idle state
		–	–	120	mA	10M Full Duplex Mode
		–	–	150	mA	100M Full Duplex Mode
Storage Temperature	$T_S$	-65	–	150	°C	–
Ambient Temperature	$T_A$	-40	–	125	°C	–
ESD robustness	$V_{ESD}$	–	–	2000	V	–

**Attention: Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.**

**Table 29 Operating Condition**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Supply Voltage	$V_{DD}$	3.0	–	3.6	V	–
Supply Current	$I_{DD}$	–	–	150	mA	–

### 5.2 DC Characteristics

**Table 30 USB Interface DC Characteristics**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input High Voltage	$V_{IH}$	2.0	–	–	V	–
Input Low Voltage	$V_{IL}$	–	–	0.8	V	–
Differential Input Sensitivity	$V_{DI}$	0.2	–	–	V	–
Differential Common Mode Range	$V_{CM}$	0.8	–	2.5	V	–
Output Low Voltage	$V_{OL}$	0.0	–	0.3	V	–

## Electrical Characteristics

Table 30 USB Interface DC Characteristics (cont'd)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Output High Voltage	$V_{OH}$	2.8	–	3.6	V	–
Output Signal Crossover Voltage	$V_{CRS}$	1.3	–	2.0	V	–

Recommended Operating Conditions.

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input High Voltage	$V_{IH}$	1.8	–	5.5	V	–
Input Low Voltage	$V_{IL}$	-0.5	–	1.0	V	–
Input Leakage Current	$I_I$	±1	–	1000	nA	$V_{IN} = 3.3\text{ V or }0\text{ V}$
Output High Voltage	$V_{CH}$	2.4	–	–	V	–
Output Low Voltage	$V_{OL}$	–	–	0.4	V	–
Input Pin Capacitance	$C_{IN}$	–	–	5.66	pF	–

Table 32 Home PNA Interface DC Characteristics

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input High Voltage	$V_{IH}$	1.8	–	5.5	V	–
Input Low Voltage	$V_{IL}$	-0.5	–	1.0	V	–
Input Leakage Current	$I_I$	±1	–	1000	nA	$V_{IN} = 3.3\text{ V or }0\text{ V}$
Output High Voltage	$V_{OH}$	2.4	–	–	V	–
Output Low Voltage	$V_{OL}$	–	–	0.4	V	–
Input Pin Capacitance	$C_{IN}$	–	–	5.63	pF	–

Table 33 GPIO Interface DC Characteristics

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input High Voltage	$V_{IH}$	1.8	–	5.5	V	–
Input Low Voltage	$V_{IL}$	-0.5	–	1.0	V	–
Input Leakage Current	$I_I$	±1	–	1000	nA	$V_{IN} = 3.3\text{ V or }0\text{ V}$
Output High Voltage	$V_{OH}$	2.4	–	–	V	–
Output Low Voltage	$V_{OL}$	–	–	0.4	V	–
Input Pin Capacitance	$C_{IN}$	–	–	5.64	pF	–

### 5.3 Reset Timing

ADM8511/X can be reset either by hardware, software or USB reset.

- A hardware reset is accomplished by asserting the RST# pin after power up the device. It should have a duration of at least 100 ms to ensure the external 48 MHz crystal is in stable and correct frequency. All registers will be reset to default values.

## Electrical Characteristics

- A software reset is accomplished by setting the reset bit (bit 4) of the Ethernet Control Register (address 01<sub>H</sub>). This software reset will reset all registers to default values.
- When ADM8511/X sees an SE0 on USB bus for more than 2.5  $\mu$ s. This USB reset will reset all registers to default values.

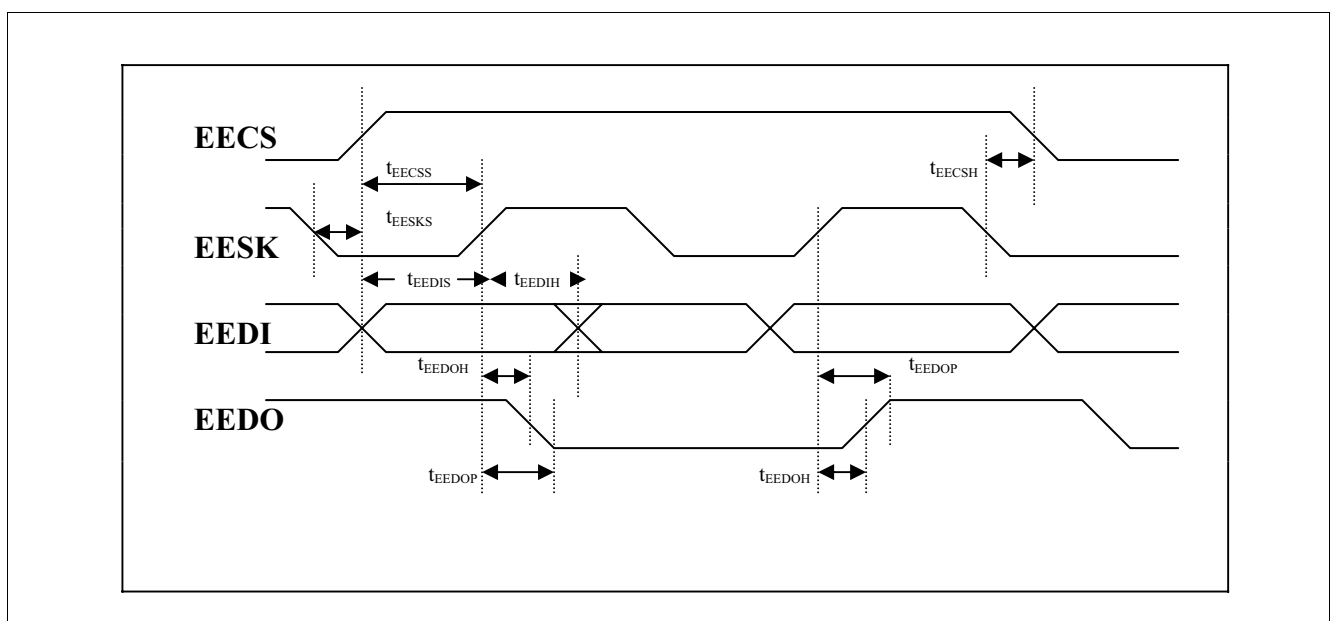

## 5.4 USB Interface Timing

**Table 34 EEPROM Interface Timing**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Rise time	$T_{FR}$	4	–	20	ns	$C_L = 50$ pF
Fall time	$T_{FF}$	4	–	20	ns	$C_L = 50$ pF
Rise and fall time matching	$T_{FRFF}$	90	–	111.11	%	$T_{FRFF} = T_{FR}/T_{FF}$

**Table 35 EEPROM Interface Timing**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
EESK Clock Frequency	$t_{EESK}$	0	–	1	MHz	–
EECS Setup Time to EESK	$T_{EECSS}$	0.2	–	–	$\mu$ s	–
EECS Hold Time from EESK	$T_{EECSH}$	0	–	–	ns	–
EEDO Hold Time from EESK	$T_{EEDOH}$	70	–	–	ns	–
EEDO Output Delay to “1” or “0”	$T_{EEDOP}$	–	–	2	$\mu$ s	–
EEDI Setup Time to EESK	$t_{EEDIS}$	0.4	–	–	$\mu$ s	–
EEDI Hold Time from EESK	$t_{EEDIH}$	0.4	–	–	$\mu$ s	–

## Note:

1. Dimensions D<sub>1</sub> and E<sub>1</sub> do not include mold protrusion. Allowable protrusion is 0.25 mm per. Side D<sub>1</sub> and E<sub>1</sub> are Maximum plastic body size dimensions including mold mismatch.
2. Dimensions b does not include dambar protrusion shall not cause the lead width to exceed the maximum b dimensions by more than 0.08 mm. Dambar can not be located on the lower radius or the foot. Maximum space between protrusion and an adjacent lead is 0.07 mm for 0.4 mm and 0.5 mm pitch packages.

## 7 APPENDIX 1 - Layout Guide

### 7.1 Placement

1. On USB side, Place PegasusII and USB connector as close as possible.
2. On Ethernet side, place PegasusII, transformer and RJ45 as close as possible.
3. The crystal or OSC device should be close to PegasusII and away from the following items:
  - a) Any analog signal
  - b) PCB edge
  - c) Any other high frequency components and their associated traces.
4. Place the filtering capacitor as close as possible at the power pin of ADM 8511 (Pegasus II) and its trace is short and wide.

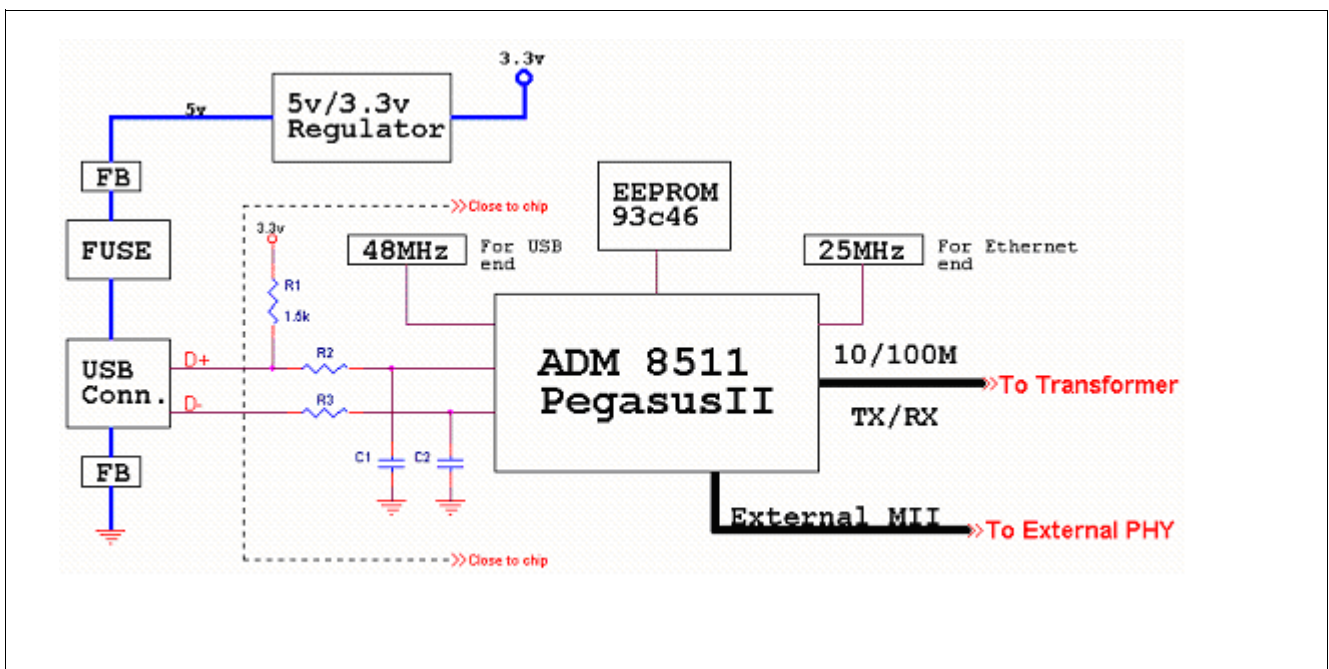

Figure 9 Correct placement

### 7.2 Trace routing

- Keep USB differential pair data signal D+ and D-:
  - Trace width should be as wide as possible.
  - Make D+ and D- traces route at the same signal plane and doesn't pass through other plane.
  - Inhibit crossover on D+ and D-
  - The termination resistance (R2,R3) and decoupling capacitors (C1,C2) should be close to ADM8511/X.
  - D+ and D- Signal trace length should be equal and as short as possible
- Arrangement Tx and Rx trace
  - Tx+/- and Rx+/- trace avoid right angle and round angle >90 degree; suggested.

Figure 10 Trace routing

- Trace width must be wide and should be wider than 8 miles.
  - Signal trace length between Tx+/- differential pairs should be cross and have equal length. The total length should be no longer than 2 cm. The same requirement also apply to Rx+/-.
  - Make Tx and Rx trace route at the same signal plane and doesn't pass through other plane.
  - Every differential pairs as cross as possible, but no less than 8 miles and space should be almost equal
  - Keep space large between Tx and Rx differential pairs, even separated ground planes underneath Tx and Rx signal pairs
  - Away from clock and power traces.
  - If Tx routed trace must cross, the trace can be swapped between chip and transformer, and transformer to RJ45, too.

Figure 11 Crossed Tx routed trace

- Digital signal should be away from analog signal and power traces. If this can't be avoided, analog and VCC should cross over 90 degree at other plane.
- Vcc trace should short and prefer to route in this plane format, special for GND.

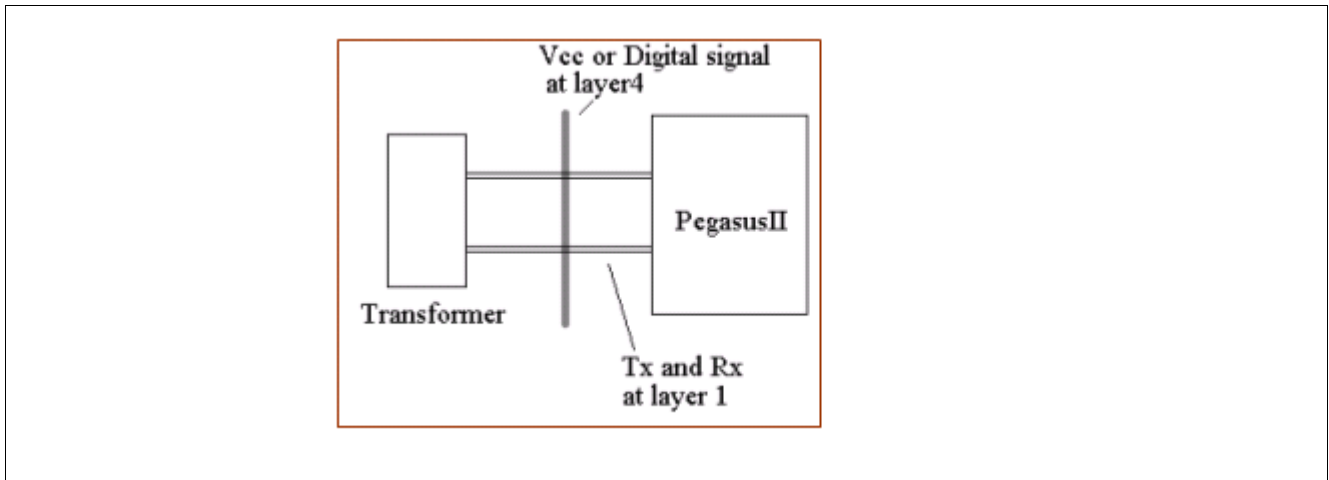

Figure 12 Vcc trace

### 7.3 Power and Ground

- Every power pin should have 0.1uF SMD capacitors placed with it. To be effective, the capacitors should be placed as close as possible at the pin.
- The chassis ground plane connected to the USB B type and network connector chassis should be isolated from the signal plane with 0.1uF capacitors or bead to prevent any radiation from leaking and resulting in FCC failure.
- Right angle is recommend when partition Vcc as well as GND planes.
- Avoid power and ground planes placing directly under the transformer. See [Figure 13](#).

Figure 13 Correct placement of power and ground planes

- If you use a permanently attached cable (plus the shield wire), it may require additional filtering for FCC test pass, and the length of unshielded cable should be limited to 3cm or less.

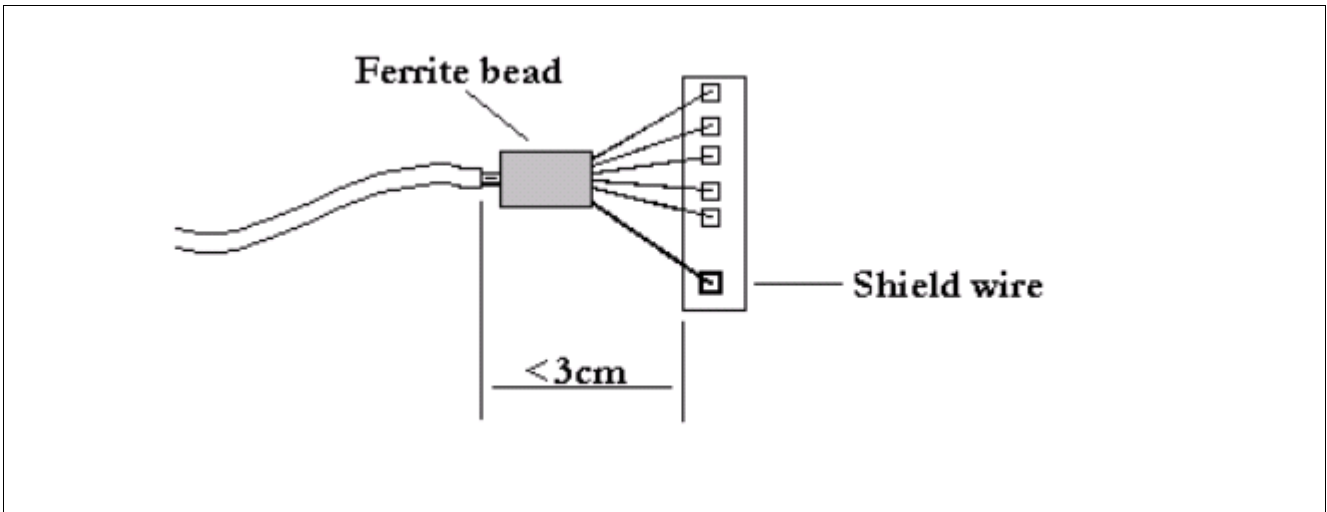

Figure 14 Limited length of unshielded cable

- Please connect pin12(GndRef) and pin8(GndR) first then use signal via to Gnd.

Figure 15 Connection of pin12(GndRef) and pin8(GndR)

## 8 APPENDIX 2 - EEPROM Interface & Example

### 8.1 General EEPROM Format Description

If the EEPROM contents from offset 0 to offset 5 is "FF\_FF\_FF\_FF\_FF\_FF", it means the EEPROM isn't programmed correctly, The default values for every field are used instead of loading from EEPROM.

**Table 38 General EEPROM Format Description**

Offset(byte)	Field	Description
00	node_id0	The 1st byte of Ethernet node ID.
01	node_id1	The 2nd byte of Ethernet node ID.
02	node_id2	The 3rd byte of Ethernet node ID.
03	node_id3	The 4th byte of Ethernet node ID.
04	node_id4	The 5th byte of Ethernet node ID.
05	node_id5	The 6th byte of Ethernet node ID.
06-07	reserved	
08	max_pwr	The maximum USB power consumption.
09	ep3_interval	The polling interval for endpoint 3. If this value is 0, EP3 is disabled.
0A[0]	iso_enable	0
0A[1]	USB transceiver Test_mode	0: select external USB transceiver. 1: select internal USB transceiver.
0A[4:2]	MII Test_mode	000b: tri-state MII pins 001b: enable MAC's MII signals to external interface 010b: enable PHY's MII signals to external interface 011b: monitor MII mode
0A[7]	Remote wakeup Enable	0: Enable 1: Disable
0B[7:6]	LED mode	Refer to pin assignment
0B[5:0]	reserved	
0C	languageid_lo	The low byte of language ID.
0D	languageid_hi	The high byte of language ID.
0E-0F	reserved	
10	manuid_lo	The low byte of manufacture ID.
11	manuid_hi	The high byte of manufacture ID.
12	proid_lo	The low byte of product ID.
13	proid_hi	The high byte of product ID.
14	manu_str_len	The length for manufacture string.
15	manu_str_offset	The word offset address of manufacture string.
16	pro_str_len	The length for product string.
17	pro_str_offset	The word offset address of product string.

## APPENDIX 2 - EEPROM Interface &amp; Example

Table 38 General EEPROM Format Description (cont'd)

Offset(byte)	Field	Description
18	seri_str_len	The length for serial number string
19	seri_str_offset	The word offset address of serial number string.

## 8.2 Example

Table 39 Example 1

offset(byte)	value
0000h	00, 00 E8 00 02 2C 00 00
0008h	50 01 02 00 09 04 00 00
0010h	A6 07 11 85 0E 10 2A 20

## 9 APPENDIX 3 - USB Device Operation

### 9.1 Endpoint 0

Endpoint 0 is in charge of response to standard USB commands and vendor specific commands. Internal registers setting are also via this endpoint. The response to each command is described in section 7.

### 9.2 Endpoint 1 bulk IN

Endpoint 1 is in charge of sending the received Ethernet packet to USB host. An Ethernet packet will be split to multiple 64-byte USB packets on USB. The end of the Ethernet packet is indicated by less than 64-byte or 0 length data transfer in this pipe. The Ethernet received status is optionally reported at the end of the packet.

While accessing to this endpoint if RX FIFO is either full or any packet is inside, the data in RX FIFO is returned in USB data stage. If ACK is received from USB host, data in RX FIFO is flushed. If no response or NAK is received from USB host, the content in RX FIFO will be re-transmitted. If RX FIFO isn't ready for transmission, NAK is returned to USB host.

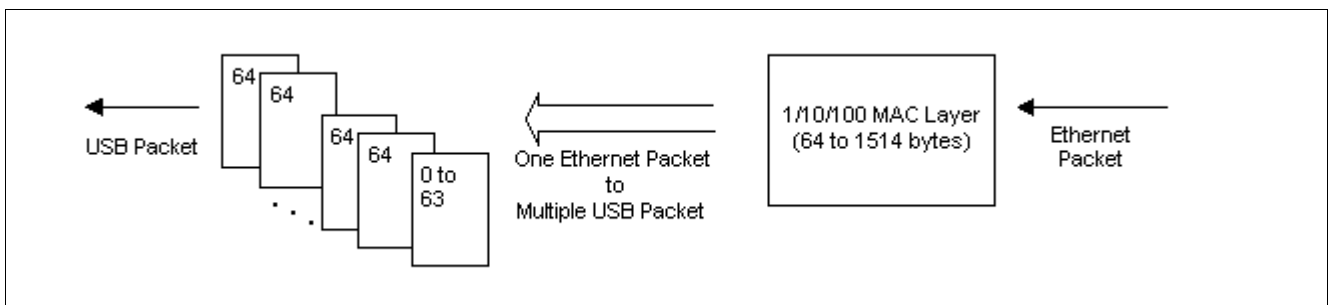

Figure 16 Transmission of RX FIFO

The received status is reported as follows:

Table 41 Received status

Offset	Bit	Field	Description
Offset0	7-0	rx_bytectl_lo	The received byte count[7:0].
Offset1	3-0	rx_bytectl_hi	The received byte count[11:8].
	7-4	reserved	
Offset2	0	Multicast_frame	Indicate receive a multicast frame.
	1	Long_pkt	Indicate received packet length > 1518 bytes
	2	Runt_pkt	Indicate received packet length < 64 bytes.
	3	crc_err	Indicate CRC check error.
	4	Dribble_bit	Indicate packet length is not integer multiple of 8-bit.
	7-5	reserved	
Offset3	7-0	reserved	

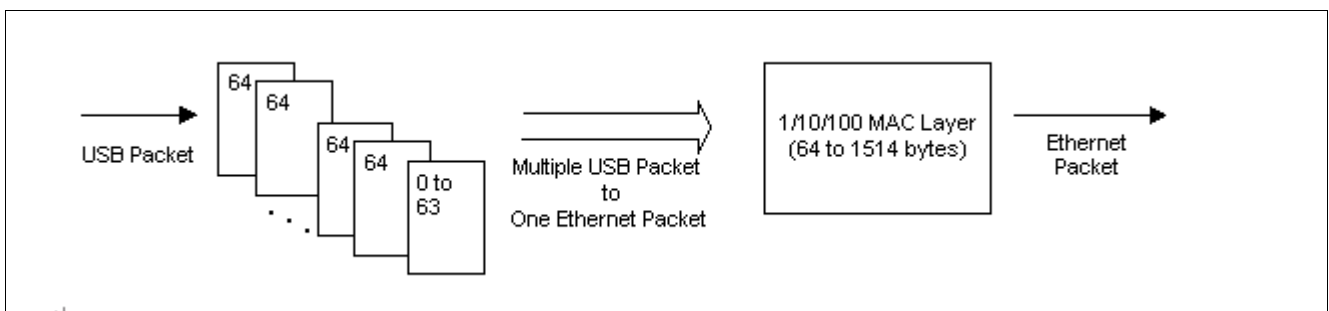

### 9.3 Endpoint 2 bulk OUT

Endpoint 2 is in charge of sending the USB packet to Ethernet. An Ethernet packet is concatenated as multiple 64-byte USB packets on USB. The first two bytes in every first concatenated USB packet indicate the total length of the Ethernet packet. The end of the Ethernet packet is indicated with less than 64-byte or 0 length data transfer in this pipe. The Ethernet transmit status is reported in transmit status register.

When access to this endpoint, data in USB data stage is transferred to TX FIFO when TX FIFO is free and ACK is returned. If TX FIFO isn't free, NAK is returned.

**Table 42 Endpoint 2 bulk OUT**

Field	1st byte in 1st USB packet	2nd byte in 1st USB packet	The following packets
Content	len[7:0]: Low byte Ethernet packet length	{reserved[4:0], len[10:8]}	Ethernet packet

**Figure 17 Sending the USB packet to Ethernet**

### 9.4 Endpoint 3 interrupt IN

Endpoint 3 is in charge of returning the current Ethernet transfer status every polling interval. When access to this endpoint, 8 bytes data is returned to USB host. The 8-byte packet contains

**Table 43 Endpoint 3 interrupt IN**

Offset0	Offset1	Offset2	Offset3	Offset4	Offset5	Offset6-7 (2B)
tx_status(Reg 2Bh)	tx_status(Reg 2Ch)	rx_status(Reg 2Dh)	rx_lostpkt(Reg 2Eh)	rx_lostpkt(Reg 2Fh)	Wakeup_status(Reg 7Ah)	0

## 10 APPENDIX 4 - USB Command

- Get\_Register (Vendor Specific) Single/Burst read

**Table 44 Setup Stage**

bmReq	bReq	wValue(2B)	wIndex(2B)	wLength(2B)
C0	F0	0	{RegIndex[0:7], 00}	length

**Table 45 Data Stage**

Offset0(1B)	Offset1(1B)	Offset2(1B)
{RegIndex}	{RegIndex+1}	{RegIndex+2}

The returned total number of registers depends on the length field.

- Set\_Register (Vendor Specific) Single write

**Table 46 Setup Stage**

bmReq	bReq	wValue(2B)	wIndex(2B)	wLength(2B)
40	F1	{value[0:7],mask[0:7]}	{RegIndex[0:7], 00}	1

- Set\_Register(Vendor Specific) Burst write

**Table 47 Setup Stage**

bmReq	bReq	wValue(2B)	wIndex(2B)	wLength(2B)
40	F1	0	{RegIndex[0:7], 00}	length

**Table 48 Data Stage**

Offset0(1B)	Offset1(1B)	Offset2(1B)	Offset3(1B)
{RegIndex}	{RegIndex+1}	{RegIndex+2}	{RegIndex+3}

Ex. Write 44 to RegIndex=05h, the transfer will be

**Table 49 Setup Stage**

bmReq	bReq	wValue(2B)	wIndex(2B)	wLength(2B)
40	FE	4400	0500	0100

If wLength > 1, more than 1 register is accessed (burst write) and mask is not supported => DataStage for 8-byte OUT transfer appears

Ex. Burst write 20 registers from RegIndex=07h and data from 01d to 20d

**Table 50 Setup Stage**

bmReq	bReq	wValue(2B)	wIndex(2B)	wLength(2B)
40	FE	0000	0700	1400

**Table 51 Data Stage - 1st OUT transfer**

Offset0(1B)	Offset1(1B)	Offset2(1B)	Offset3(1B)	Offset4(1B)	Offset5(1B)	Offset6(1B)	Offset7(1B)
01	02	03	04	05	06	07	08

**Table 52 Data Stage - 2nd OUT transfer**

Offset0(1B)	Offset1(1B)	Offset2(1B)	Offset3(1B)	Offset4(1B)	Offset5(1B)	Offset6(1B)	Offset7(1B)
09	02	0A	0B	0C	0D	0E	10

**Table 53 Data Stage - 3rd OUT transfer**

Offset0(1B)	Offset1(1B)	Offset2(1B)
11	12	13

- Get\_Status(Device)

**Table 54 Setup Stage**

bmReq	bReq	wValue(2B)	wIndex(2B)	wLength(2B)
80	0	0	0	2

**Table 55 Data Stage**

D[15:2]	D[1]: Remote Wakeup	D[0]: Self Powered
0	Register of remote_wakeup	1

- Get\_Status(Interface)

**Table 56 Setup Stage**

bmReq	bReq	wValue(2B)	wIndex(2B)	wLength(2B)
81	0	0	0	2

**Table 57 Data Stage**

D[15:0]
0

- Get\_Status(EP0)

**Table 58 Setup Stage**

bmReq	bReq	wValue(2B)	wIndex(2B)	wLength(2B)
82	0	0	0080 or 0000	2

**Table 59 Data Stage**

D[15:1]	D[0]: Halt
0	register of ep0_halt

- Get\_Status(EP1) bulk IN

**Table 60 Setup Stage**

bmReq	bReq	wValue(2B)	wIndex(2B)	wLength(2B)
82	0	0	0081	2

**Table 61 Data Stage**

D[15:1]	D[0]: Halt

## 11 APPENDIX 5 - Design Notes for Ethernet & MII Application(HPNA&HomePlug)

### 11.1 48MHz Crystal

ADM8511/X need a 48 MHz crystal (+/- 50ppm,over tone) to work on USB side. Because the 48 MHz crystal is a over tone part, It need work with a L/C pair. However, 48 MHz fundamental crystal is also valid and associates with two ceramic capacitor.

### 11.2 SRAM

All of the SRAM pin can be NC (No Connection).

### 11.3 RST# and POREN\_N

- Internal Power On Reset in ethernet only or combo (Ethernet & HPNA) solution: The ADM8511/X provides internal power reset. In ethernet only or combo solution, you can let RST# and POREN\_N pin NC.
- External reset in external PHY only solution.(e.g. Home PNA only) Condition: (1) POREN\_N pull to high and (2) RST# asserts low when external reset is active.

RST# combines with a reset circuit (e.g. RC circuit) to provide a low pulse to be reset signal. The duration of the low pulse is 50ms at least. The recommended time is more than 80ms. Moreover, it still needs 25MHz crystal oscillation circuit and Ribb pin connects a 10K resistor to ground.

### 11.4 XLNKSTS

1. Ethernet only solution: This pin need strapping to low directly
2. Combo or External PHY only solution: reports link status information to system and level change trigger.

### 11.5 LED

All of the LED pin are active Low and only display internal PHY status.

### 11.6 Ethernet pin (LED,XTLP/N,TXOP/N,RXIP/N,RIBB,TST0.....K3

In External PHY solution, All can be NC.

### 11.7 MII interface signal pins

- In ethernet only solution: All of the MII pin can be NC.
- In combo or external PHY only solution
  - MDIO requires external 1.5k pull-up resistor.
  - TXEN requires external 4.7k pull-down resistor. If the external PHY did not provide RXER, this pin needs strapping to low directly.
