

**Features**

- SMPTE 424M, 292M, and 259M-C compliant
- Supports data rates of 270, 1483.5, 1485, 2967, 2970Mb/s
- Supports DVB-ASI at 270Mb/s
- Pb-free and RoHS Compliant
- Auto and Manual Modes for rate selection
- Standards indication in Auto Mode
- 4:1 input multiplexer patented technology
- Choice of dual reclocked data outputs or one data output and one recovered clock output
- Footprint and drop-in compatible with existing GS2975 designs
- Loss of Signal (LOS) Output
- Lock Detect Output
- On-chip Input and Output Termination
- Differential 50Ω inputs and outputs
- Mute, Bypass and Autobypass functions
- SD/HD indication output to control GS2978 Dual Slew-Rate Cable Driver
- Single 3.3V power supply
- Operating temperature range: 0°C to 70°C

**Applications**

- SMPTE 424M, SMPTE 292M and SMPTE 259M-C Serial Digital Interfaces

**Description**

The GS2975A is a Multi-Rate Serial Digital Reclocker designed to automatically recover the embedded clock from a digital video signal and re-time the incoming video data.

The GS2975A Serial Digital Reclocker will recover the embedded clock signal and re-time the data from a SMPTE 424M, SMPTE 292M, or SMPTE 259M-C compliant digital video signal.

The GS2975A removes the high frequency jitter components from the bit-serial stream. Input termination is on-chip for seamless matching to 50Ω transmission lines.

The GS2975A can operate in either auto or manual rate selection mode. In Auto mode the device will automatically detect and lock onto incoming SMPTE SDI data signals at any supported rate. For single rate data systems, the GS2975A can be configured to operate in Manual mode. In both modes, the device requires only one external crystal to set the VCO frequency when not locked and provides adjustment free operation.

In systems which require passing of non-SMPTE data rates, the GS2975A can be configured to either automatically or manually enter a bypass mode in order to pass the signal without reclocking.

The GS2975A offers a choice of dual reclocked data outputs or one data output and one recovered clock output. The device is footprint and drop-in compatible with existing GS2975 designs, with no additional application changes required.

The GS2975A is Pb-free, and the encapsulation compound does not contain halogenated flame retardant.

This component and all homogeneous sub-components are RoHS compliant.

| Pin Number | Name       | Type       | Description                                                                                                                                          |
|------------|------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 60         | VEE_CP     | Power      | Most negative power supply connection for the internal charge pump. Connect to GND.                                                                  |
| 61         | VCC_CP     | Power      | Most positive power supply connection for the internal charge pump. Connect to 3.3V.                                                                 |
| 62, 63     | LF+, LF-   | Passive    | Loop filter capacitor connection. Connect as shown in the <a href="#">Typical Application Circuit on page 23</a> .                                   |
| 64         | NC         | No Connect | Not connected internally. Recommended connect to GND.                                                                                                |
| –          | Center Pad | –          | Ground pad on bottom of package.<br>Solder to main ground plane following recommendations under <a href="#">Recommended PCB Footprint on page 25</a> |

## 2. Electrical Characteristics

### 2.1 Absolute Maximum Ratings

| Parameter                   | Value                                            |
|-----------------------------|--------------------------------------------------|
| Supply Voltage Range        | -0.5V to +3.6 V <sub>DC</sub>                    |
| Input Voltage Range         | V <sub>ee</sub> - 0.5V to V <sub>cc</sub> + 0.5V |
| Operating Temperature Range | -20°C to 85°C                                    |
| Storage Temperature Range   | -50°C < T <sub>s</sub> < 125°C                   |
| Input ESD Voltage           | 4kV HBM, 100V MM                                 |
| Solder Reflow Temperature   | 260°C                                            |

NOTE: Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions or at any other condition beyond those indicated in the AC/DC Electrical Characteristic sections is not implied.

### 2.2 DC Electrical Characteristics

**Table 2-1: DC Electrical Characteristics**

V<sub>CC</sub> = 3.3V ±5%, T<sub>A</sub> = 0°C to 70°C, unless otherwise shown. Typical values: V<sub>CC</sub> = 3.3V and T<sub>A</sub> = 25°C

| Parameter                                                                           | Symbol          | Conditions             | Min   | Typ | Max   | Units |

## 2.4 Solder Reflow Profiles

The device is manufactured with Matte-Sn terminations and is compatible with both standard eutectic and Pb-free solder reflow profiles. MSL qualification was performed using the maximum Pb-free reflow profile shown in [Figure 2-3](#). The recommended standard Pb reflow profile is shown in [Figure 2-4](#).

## 4. Detailed Description

The GS2975A is a Multi-Rate Serial Digital Reclocker designed to automatically recover the embedded clock from a digital video signal and re-time the incoming video data.

The GS2975A will recover the embedded clock signal and re-time the data from a SMPTE 424M, SMPTE 292M, or SMPTE 259M-C compliant digital video signal.

Using the functional block diagram ([page 2](#)) as a guide, [Slew Rate Phase Lock Loop \(S-PLL\) on page 17](#) to [on page 22](#) describes each aspect of the GS2975A in detail.

### 4.1 Slew Rate Phase Lock Loop (S-PLL)

The term “slew” refers to the output phase of the PLL in response to a step change at the input. Linear PLLs have an output phase response characterized by an exponential response whereas an S-PLL’s output is a ramp response (see [Figure 4-1](#)). Because of this non-linear response characteristic, traditional small signal analysis is not possible with an S-PLL.

**Figure 4-1: PLL Characteristics**

The S-PLL offers several advantages over the linear PLL. The Loop Bandwidth of an S-PLL is independent of the transition density of the input data. Pseudo-random data has a transition density of 0.5 versus a pathological signal which has a transition density of 0.05. The loop bandwidth of a linear PLL will change proportionally with this change in transition density. With an S-PLL, the loop bandwidth is defined by the jitter at the data input. This translates to infinite loop bandwidth with a zero jitter input signal. This allows the loop to correct for small variations in the input jitter quickly, resulting in very low output jitter. The loop bandwidth of the GS2975A's PLL is defined at 0.2UI of input jitter.

The PLL consists of two acquisition loops. First is the Frequency Acquisition (FA) loop. This loop is active when the device is not locked and is used to achieve lock to the supported data rates. Second is the phase acquisition (PA) loop. Once locked, the PA loop tracks the incoming data and makes phased corrections to produce a re-clocked output.

## 4.2 VCO

The internal VCO of the GS2975A is an LC oscillator. It is trimmed at the time of manufacture to capture all data rates over temperature and operation voltage ranges.

Integrated into the VCO is a series of programmable dividers used to achieve all serial data rates, as well as additional dividers for the frequency acquisition loop.

## 4.3 Charge Pump

During frequency acquisition, the charge pump has two states, "pump-up" and "pump-down," which is produced by a leading or lagging phase difference between the input and the VCO frequency.

During phase acquisition, there are two levels of "pump-up" and two levels of "pump down" produced for leading and lagging phase difference between the input and VCO frequency. This is to allow for greater precision of VCO control.

The charge pump produces these signals by holding the integrated frequency information on the external loop-filter capacitor,  $C_{LF}$ . The instantaneous frequency information is the result of the current flowing through an internal resistor connected to the loop-filter capacitor.

## 4.4 Frequency Acquisition Loop — The Phase-Frequency Detector

An external crystal of 14.140 MHz is used as a reference to keep the VCO centered at the last known data rate. This allows the device to achieve a fast synchronous lock, especially in cases where a known data rate is interrupted. The crystal reference is also used to clock internal timers and counters. To keep the optimal performance of the reclocker over all operating conditions, the crystal frequency must be 14.140 MHz,  $\pm 50$ ppm. The GO1535 meets this specification and is available from GENNUM.

The VCO is divided by a selected ratio which is dependant on the input data rate. The resultant is then compared to the crystal frequency. If the divided VCO frequency and the crystal frequency are within 1% of each other, the PLL is considered to be locked to the input data rate.

## 4.5 Phase Acquisition Loop — The Phase Detector

The phase detector is a digital quadrature phase detector. It indicates whether the input data is leading or lagging with respect to a clock that is in phase with the VCO (I-clk) and a quadrature clock (Q-clk). When the phase acquisition loop (PA loop) is locked, the input data transition is aligned to the falling edge of I-clk and the output data is re-timed on the rising edge of I-clk. During high input jitter conditions ( $>0.25$ UI), Q-clk will sample a different value than I-clk. In this condition, two extra phase correction signals will be generated which instructs the charge pump to create larger frequency corrections for the VCO.

**Figure 4-2: Phase Detector Characteristics**

When the PA loop is active, the crystal frequency and the incoming data rate are compared. If the resultant is more than 2%, the PLL is considered to be unlocked and the system jumps to the FA loop.

## 4.6 4:1 Input Mux

The 4:1 input mux allows the connection of four independent streams of video/data. There are four differential inputs (DDI[3:0] and  $\overline{\text{DDI}}[3:0]$ ). The active channel can be selected via the DDI\_SEL[1:0] pins. Table 4-1 shows the input selected for a given state at DDI\_SEL[1:0].

**Table 4-1: Bit Pattern for Input Select**

| DDI_SEL[1:0] | Selected Input |
|--------------|----------------|
| 00           | DDI0           |
| 01           | DDI1           |
| 10           | DDI2           |
| 11           | DDI3           |

The DDI inputs are designed to be DC interfaced with the output of the GS2974 Cable Equalizer. There are on chip  $50\Omega$  termination resistors which come to a common point at the DDI\_VT pins. Connect a 10nF capacitor to this pin and connect the other end of the capacitor to ground. This terminates the transmission line at the inputs for optimum performance.

If only one input pair is used, connect the unused positive inputs to +3.3V and leave the unused negative inputs floating. This helps to eliminate crosstalk from potential noise that would couple to the unused input pair.

## 4.7 Automatic and Manual Data Rate Selection

The GS2975A can be configured to manually lock to a specific data rate or automatically search for and lock to the incoming data rate. The AUTO/MAN pin selects automatic data rate detection mode (Auto mode) when HIGH and manual data rate selection mode (Manual mode) when LOW.

In Auto mode, the SS[2:0] bi-directional pins become outputs and the bit pattern indicates the data rate that the PLL is locked to (or previously locked to). The "search algorithm" cycles through the data rates and starts over if that data rate is not found (see Figure 4-3).

**Figure 4-3: Data Rate Search Pattern**

In Manual mode, the data rate can be programmed and the SS[2:0] pins become inputs. In this mode, the search algorithm is disabled and the PLL will only lock to the data rate selected.

Table 4-2 shows the SS[2:0] pin settings for either the data rate selected (in Manual mode) or the data rate that the PLL has locked to (in Auto mode).

**Table 4-2: Data Rate Indication/Selection Bit Pattern**

| SS[2:0] | Data Rate [Mb/s] |
|---------|------------------|
| 010     | 270              |
| 101     | 1485 (1483.5)    |
| 110     | 2970 (2967)      |

## 4.8 Bypass Mode

In Bypass mode, the GS2975A passes the data at the inputs directly to the outputs. There are two pins that control the bypass function: BYPASS and AUTOBYPASS.

When BYPASS is set HIGH, the GS2975A will be in Bypass mode.

When AUTOBYPASS is set HIGH, the GS2975A will be configured to enter Bypass mode only when the PLL has not locked to a data rate. When BYPASS is set HIGH, AUTOBYPASS will be ignored.

When the PLL is not locked, and both BYPASS and AUTOBYPASS are set LOW, the serial digital output DDO0/DDO0 or DDO1/DDO1 will produce invalid data.

## 4.9 DVB-ASI Operation

The GS2975A will also re-clock DVB-ASI at 270 Mb/s. In auto mode, the device will automatically lock to the incoming 270Mb/s signal. In manual mode, the SS[2:0] pins must be set to 010 (270 Mb/s) to ensure proper operation.

## 4.10 Lock and LOS

The LOCKED signal is an active high output which indicates when the PLL is locked.

The internal lock logic of the GS2975A includes a system which monitors the Frequency Acquisition Loop and the Phase Acquisition Loop as well as a monitor to detect harmonic lock.

The LOS (Loss of Signal) output is an active HIGH output which indicates the absence of data transitions at the DDlx input. In order for this output to be asserted, transitions must not be present for a period of  $t_{LA} = 5 - 10$  us. After this output has been asserted, LOS will deassert within  $t_{LD} = 0 - 5$  us after the appearance of a transition at the DDlx input.

**Figure 4-4: LOS signal timing**

NOTE: LOS is sensitive to transitions appearing at the input, and does not distinguish between transitions caused by input data, and transitions due to noise.

## 4.11 Output Drivers and Output Mute

The GS2975A offers a choice of dual reclocked data outputs or one data output and one recovered clock output. [Table 4-3](#) shows the correlation of the output pins to the corresponding input select pins.

**Table 4-3: Configuration of Output Drivers and Output Mute Pins**

| $\overline{\text{DDO\_MUTE}}$ | $\overline{\text{RCO\_MUTE}}$ | DATA/CLOCK | DDO0 | RCO/DDO1   |
|-------------------------------|-------------------------------|------------|------|------------|
| 1                             | 1                             | 0          | DATA | CLOCK      |
| 1                             | 1                             | 1          | DATA | DATA       |
| 0                             | 1                             | 0          | MUTE | CLOCK      |
| 0                             | 1                             | 1          | MUTE | MUTE       |
| 1                             | 0                             | X          | DATA | Power Down |
| 0                             | 0                             | X          | MUTE | Power Down |

NOTE:

MUTE = Outputs latched at previous data bit.

Power down = Outputs pulled to  $V_{CC}$  through  $50\Omega$  resistor.

## 5. Typical Application Circuit

**Figure 5-1: GS2975A Typical Application Circuit**

NOTE: The GS2975A is drop-in compatible with the GS2975 application circuit. In the GS2975 application circuit pin 37 is connected to ground. If the GS2975A is dropped into the GS2975 app circuit, the RCO/DDO1 and RCO/DDO1 pins will output the recovered clock.

## 6. Package & Ordering Information

### 6.1 Package Dimensions

## 6.2 Recommended PCB Footprint

The center pad of the PCB footprint should be connected to the ground plane by a minimum of 36 vias.

NOTE: Suggested dimensions only. Final dimensions should conform to customer design rules and process optimizations.

## 6.3 Packaging Data

| Parameter                                                            | Value                |
|----------------------------------------------------------------------|----------------------|
| Package Type                                                         | 9mm x 9mm 64-pin QFN |
| Moisture Sensitivity Level (per JEDEC J-STD-020C)                    | 3                    |
| Junction to Case Thermal Resistance, $\theta_{j-c}$                  | 9.1°C/W              |
| Junction to Air Thermal Resistance, $\theta_{j-a}$ (at zero airflow) | 21.5°C/W             |
| Junction to Board Thermal Resistance, $\theta_{j-b}$                 | 5.6°C/W              |
| Psi, $\Psi$                                                          | 0.2°C/W              |
| Pb-free and RoHS Compliant                                           | Yes                  |

## 6.4 Marking Diagram
