

- 80-ns Instruction Cycle Time
- 544 Words of On-Chip Data RAM
- 4K Words of On-Chip Secure Program EPROM (TMS320E25)
- 4K Words of On-Chip Program ROM (TMS320C25)
- 128K Words of Data/Program Space
- 32-Bit ALU/Accumulator
- 16×16 -Bit Multiplier With a 32-Bit Product
- Block Moves for Data/Program Management
- Repeat Instructions for Efficient Use of Program Space
- Serial Port for Direct Codec Interface
- Synchronization Input for Synchronous Multiprocessor Configurations
- Wait States for Communication to Slow Off-Chip Memories/Peripherals
- On-Chip Timer for Control Operations
- Single 5-V Supply
- Packaging: 68-Pin PGA, PLCC, and CER-QUAD
- 68-to-28 Pin Conversion Adapter Socket for EPROM Programming
- Commercial and Military Versions Available
- NMOS Technology:
 - TMS32020 200-ns cycle time
- CMOS Technology:
 - TMS320C25 100-ns cycle time
 - TMS320E25 100-ns cycle time
 - TMS320C25-50 80-ns cycle time

description

This data sheet provides complete design documentation for the second-generation devices of the TMS320 family. This facilitates the selection of the devices best suited for user applications by providing all specifications and special features for each TMS320 member. This data sheet is divided into four major sections: architecture, electrical specifications (NMOS and CMOS), timing diagrams, and mechanical data. In each of these sections, generic information is presented first, followed by specific device information. An index is provided for quick reference to specific information about a device.

ADVANCE INFORMATION

TMS320 SECOND-GENERATION DEVICES

SPRS010B — MAY 1987 — REVISED NOVEMBER 1990

SIGNALS	I/O/Z [‡]	DEFINITION
V _{CC}	I	5-V supply pins
V _{SS}	I	Ground pins
X1	O	Output from internal oscillator for crystal
X2/CLKIN	I	Input to internal oscillator from crystal or external clock
CLKOUT1	O	Master clock output (crystal or CLKIN frequency/4)
CLKOUT2	O	A second clock output signal
D15-D0	I/O/Z	16-bit data bus D15 (MSB) through D0 (LSB). Multiplexed between program, data, and I/O spaces.
A15-A0	O/Z	16-bit address bus A15 (MSB) through A0 (LSB)
$\overline{\text{PS}}$, $\overline{\text{DS}}$, $\overline{\text{IS}}$	O/Z	Program, data, and I/O space select signals
$\overline{\text{R/W}}$	O/Z	Read/write signal
$\overline{\text{STRB}}$	O/Z	Strobe signal
$\overline{\text{RS}}$	I	Reset input
$\overline{\text{INT2}}$ - $\overline{\text{INT0}}$	I	External user interrupt inputs
$\overline{\text{MP/MC}}$	I	Microprocessor/microcomputer mode select pin
$\overline{\text{MSC}}$	O	Microstate complete signal
$\overline{\text{IACK}}$	O	Interrupt acknowledge signal
READY	I	Data ready input. Asserted by external logic when using slower devices to indicate that the current bus transaction is complete.
$\overline{\text{BR}}$	O	Bus request signal. Asserted when the TMS320C2x requires access to an external global data memory space.
XF	O	External flag output (latched software-programmable signal)
$\overline{\text{HOLD}}$	I	Hold input. When asserted, TMS320C2x goes into an idle mode and places the data, address, and control lines in the high impedance state.
$\overline{\text{HOLDA}}$	O	Hold acknowledge signal
$\overline{\text{SYNC}}$	I	Synchronization input
$\overline{\text{BIO}}$	I	Branch control input. Polled by BIOZ instruction.
DR	I	Serial data receive input
CLKR	I	Clock for receive input for serial port
FSR	I	Frame synchronization pulse for receive input
DX	O/Z	Serial data transmit output
CLKX	I	Clock for transmit output for serial port
FSX	I/O/Z	Frame synchronization pulse for transmit. Configuration as either an input or an output.

[‡] I/O/Z denotes input/output/high-impedance state.

description

The TMS320 family of 16/32-bit single-chip digital signal processors combines the flexibility of a high-speed controller with the numerical capability of an array processor, thereby offering an inexpensive alternative to multichip bit-slice processors. The highly paralleled architecture and efficient instruction set provide speed and flexibility to produce a MOS microprocessor family that is capable of executing more than 12.5 MIPS (million instructions per section). The TMS320 family optimizes speed by implementing functions in hardware that other processors implement through microcode or software. This hardware-intensive approach provides the design engineer with processing power previously unavailable on a single chip.

The TMS320 family consists of three generations of digital signal processors. The first generation contains the TMS32010 and its spinoffs. The second generation includes the TMS32020, TMS320C25, and TMS320E25, which are described in this data sheet. The TMS320C30 is a floating-point DSP device designed for even higher performance. Many features are common among the TMS320 processors. Specific features are added in each processor to provide different cost/performance tradeoffs. Software compatibility is maintained throughout the family to protect the user's investment in architecture. Each processor has software and hardware tools to facilitate rapid design.

introduction

The TMS32010, the first NMOS digital signal processor in the TMS320 family, was introduced in 1983. Its powerful instruction set, inherent flexibility, high-speed number-crunching capabilities, and innovative architecture have made this high-performance, cost-effective processor the ideal solution to many telecommunications, computer, commercial, industrial, and military applications. Since that time, the TMS320C10, a low-power CMOS version of the industry-standard TMS32010, and other spinoff devices have been added to the first generation of the TMS320 family.

The second generation of the TMS320 family (referred to as TMS320C2x) includes four members, the TMS32020, TMS320C25, TMS320C25-50, and TMS320E25. The architecture of these devices is based upon that of the TMS32010.

The **TMS32020**, processed in NMOS technology, is source-code compatible with the TMS32010 and in many applications is capable of two times the throughput of the first-generation devices. Its enhanced instruction set (109 instructions), large on-chip data memory (544 words), large memory spaces, on-chip serial port, and hardware timer make the TMS32020 a powerful addition to the TMS320 family.

The **TMS320C25** is the second member of the TMS320 second generation. It is processed in CMOS technology, is capable of an instruction cycle time of 100 ns, and is pin-for-pin and object-code compatible with the TMS32020. The TMS320C25's enhanced feature set greatly increases the functionality of the device over the TMS32020. Enhancements included 24 additional instructions (133 total), eight auxiliary registers, an eight-level hardware stack, 4K words of on-chip program ROM, a bit-reversed indexed-addressing mode, and the low-power dissipation inherent to the CMOS process. An extended-temperature range version (TMS320C25GBA) is also available.

The **TMS320C25-50** is a high-speed version of the TMS320C25. It is capable of an instruction cycle time of less than 80 ns. It is architecturally identical to the original 40-MHz version of the TMS320C25 and, thus, is pin-for-pin and object-code compatible with the TMS320C25.

The **TMS320E25** is identical to the TMS320C25, with the exception that the on-chip 4K-word program ROM is replaced with a 4K-word on-chip program EPROM. On-chip EPROM allows realtime code development and modification for immediate evaluation of system performance.

TMS320 SECOND-GENERATION DEVICES

SPRS010B — MAY 1987 — REVISED NOVEMBER 1990

Key Features: TMS32020

- 200-ns Instruction Cycle Time
- 544 Words of On-Chip Data RAM
- 128K Words of Total Data/Program Memory Space
- Wait States for Communication to Slower Off-Chip Memories
- Source Code Compatible With the TMS320C1x
- Single-Cycle Multiply/Accumulate Instructions
- Repeat Instructions
- Global Data Memory Interface
- Block Moves for Data/Program Management
- Five Auxiliary Registers With Dedicated Arithmetic Unit
- Serial Port for Multiprocessing or Interfacing to Codecs, Serial Analog-to-Digital Converters, etc.

- On-Chip Clock Generator
- Single 5-V Supply
- NMOS Technology
- 68-Pin Grid Array (PGA) Package

Key Features: TMS320C25, TMS320C25-50, TMS320E25

- 80-ns Instruction Cycle Time (TMS320C25-50)
- 100-ns Instruction Cycle Time (TMS320C25)
- 4K Words of On-Chip Secure Program EPROM (TMS320E25)
- 4K Words of On-Chip Program ROM (TMS320C25)
- 544 Words of On-Chip RAM
- 128K Words of Total Program/Data Memory Space
- Wait States for Communications to Slower Off-Chip Memories
- Object-Code Compatible With the TMS32020
- Source-Code Compatible With TMS320C1x
- 24 Additional Instructions to Support Adaptive Filtering, FFTs, and Extended-Precision Arithmetic
- Block Moves for Data/Program Management
- Single-Cycle Multiply/Accumulate Instructions
- Eight Auxiliary Registers With Dedicated Arithmetic Unit
- Bit-Reversed Indexed-Addressing Mode for Radix-2 FFTs
- Double-Buffered Serial Port

- On-Chip Clock Generator
- Single 5-V Supply
- Internal Security Mechanism (TMS320E25)
- 68-to-28 Pin Conversion Adapter Socket
- CMOS Technology
- 68-Pin Grid Array (PGA) Package (TMS320C25)
- 68-Lead Plastic Leaded Chip Carrier (PLCC) Package (TMS320C25, TMS320C25-50)
- 68-Lead CER-QUAD Package (TMS320E25)

Table 1 provides an overview of the second-generation TMS320 processors with comparisons of memory, I/O, cycle timing, power, package type, technology, and military support. For specific availability, contact the nearest TI Field Sales Office.

Table 1. TMS320 Second-Generation Device Overview

DEVICE	MEMORY				I/O†			TIMER	CYCLE TIME (ns)	TYP POWER (mW)	PACKAGE TYPE

† SER = serial; PAR = parallel; DMA = direct memory access; CON = concurrent DMA.

‡ Military version available; contact nearest TI Field Sales Office for availability.

§ Military version planned; contact nearest TI Field Sales Office for details.

architecture

The TMS320 family utilizes a modified Harvard architecture for speed and flexibility. In a strict Harvard architecture, program and data memory lie in two separate spaces, permitting a full overlap of instruction fetch and execution. The TMS320 family's modification of the Harvard architecture allows transfers between program and data spaces, thereby increasing the flexibility of the device. This modification permits coefficients stored in program memory to be read into the RAM, eliminating the need for a separate coefficient ROM. It also makes available immediate instructions and subroutines based on computed values.

Increased throughput on the TMS320C2x devices for many DSP applications is accomplished by means of single-cycle multiply/accumulate instructions with a data move option, up to eight auxiliary registers with a dedicated arithmetic unit, and faster I/O necessary for data-intensive signal processing.

The architectural design of the TMS320C2x emphasizes overall speed, communication, and flexibility in processor configuration. Control signals and instructions provide floating-point support, block-memory transfers, communication to slower off-chip devices, and multiprocessing implementations.

32-bit ALU/accumulator

The 32-bit Arithmetic Logic Unit (ALU) and accumulator perform a wide range of arithmetic and logical instructions, the majority of which execute in a single clock cycle. The ALU executes a variety of branch instructions dependent on the status of the ALU or a single bit in a word. These instructions provide the following capabilities:

- Branch to an address specified by the accumulator
- Normalize fixed-point numbers contained in the accumulator
- Test a specified bit of a word in data memory

One input to the ALU is always provided from the accumulator, and the other input may be provided from the Product Register (PR) of the multiplier or the input scaling shifter which has fetched data from the RAM on the data bus. After the ALU has performed the arithmetic or logical operations, the result is stored in the accumulator.

The 32-bit accumulator is split into two 16-bit segments for storage in data memory. Additional shifters at the output of the accumulator perform shifts while the data is being transferred to the data bus for storage. The contents of the accumulator remain unchanged.

SPRS010B — MAY 1987 — REVISED NOVEMBER 1990

The diagram illustrates the internal architecture of the TMS320C49 DSP, organized into two main functional blocks connected by a Program Bus and a Data Bus.

Top Block (Program Bus Interface):

- Controller:** Manages system operations, receiving control signals (SYNC, IS, DS, PS, R/W, STRB, READY, BR, XF, HOLD, HOLDA, MSC, BIO, RS, IACK, MP/MC, INT(2-0)) and outputting status signals (X1, X2/CLKIN, CLKOUT1, CLKOUT2).
- Program Bus:** Connects the Controller to the Program Memory and Registers.
- Program Memory:** Includes Program ROM/EPROM (4096 x 16) and a Stack (8 x 16).
- Registers:** A set of 16 registers including QIR(16), IR(16), STO(16), ST1(16), RPTC(8), IFR(6), RSR(16), XSR(16), DRR(16), DXR(16), TIM(16), PRD(16), IMR(6), and GREG(8).

Bottom Block (Data Bus Interface):

- Data Bus:** Connects the top block to the bottom block.
- Registers and Memory:** Includes AR0(16) through AR7(16), ARAU(16), DP(9), and various memory blocks (Block B2, Data RAM, Block B1, DATA/PROG RAM, Block B0).
- Functional Blocks:** Includes a Multiplier, Shifter(0-16), Shifter(-6, 0, 1, 4), ALU(32), and Shifters (0-7)†.

ACCH = Accumulator high
ACCL = Accumulator low
ALU = Arithmetic logic unit
ARAU = Auxiliary register arithmetic unitMCS
ARB = Auxiliary register pointer buffer
ARP = Auxiliary register pointer
DP = Data memory page pointer
DRR = Serial port data receive registerTIM
DXR = Serial port data transmit register

IFR	=	Interrupt flag register
IMR	=	Interrupt mask register
IR	=	Instruction register
	=	Microcall stack
QIR	=	Queue instruction register
PR	=	Product register
PRD	=	Period register for time
	=	Timer
TR	=	Temporary register

	PC	=	Program counter
	PFC	=	Prefetch counter
	RPTC	=	Repeat instruction counter
GREG		=	Global memory allocation register
ster	RSR	=	Serial port receive shift register
er	XSR	=	Serial port transmit shift register
	AR0-AR7	=	Auxiliary registers
ST0, ST1		=	Status registers
	C	=	Carry bit

scaling shifter

The TMS320C2x scaling shifter has 16-bit input connected to the data bus and a 32-bit output connected to the ALU. The scaling shifter produces a left shift of 0 to 16 bits on the input data, as programmed in the instruction. The LSBs of the output are filled with zeroes, and the MSBs may be either filled with zeroes or sign-extended, depending upon the status programmed into the SXM (sign-extension mode) bit of status register ST1.

16 × 16-bit parallel multiplier

The 16 × 16-bit hardware multiplier is capable of computing a signed or unsigned 32-bit product in a single machine cycle. The multiplier has the following two associated registers.

- A 16-bit Temporary Register (TR) that holds one of the operands for the multiplier, and
- A 32-bit Product Register (PR) that holds the product.

Incorporated into the instruction set are single-cycle multiply/accumulate instructions that allow both operands to be processed simultaneously. The data for these operations may reside anywhere in internal or external memory, and can be transferred to the multiplier each cycle via the program and data buses.

Four product shift modes are available at the Product Register (PR) output that are useful when performing multiply/accumulate operations, fractional arithmetic, or justifying fractional products.

timer

The TMS320C2x provides a memory-mapped 16-bit timer for control operations. The on-chip timer (TIM) register is a down counter that is continuously clocked by CLKOUT1 on the TMS320C25. The timer is clocked by CLKOUT1/4 on the TMS32020. A timer interrupt (TINT) is generated every time the timer decrements to zero. The timer is reloaded with the value contained in the period (PRD) register within the next cycle after it reaches zero so that interrupts may be programmed to occur at regular intervals of $PRD + 1$ cycles of CLKOUT 1 on the TMS320C25 or $4 \times PRD \times CLKOUT$ 1 cycles on the TMS32020.

memory control

The TMS320C2x provides a total of 544 16-bit words of on-chip data RAM, divided into three separate blocks (B0, B1, and B2). Of the 544 words, 288 words (blocks B1 and B2) are always data memory, and 256 words (block B0) are programmable as either data or program memory. A data memory size of 544 words allows the TMS320C2x to handle a data array of 512 words (256 words if on-chip RAM is used for program memory), while still leaving 32 locations for intermediate storage. When using block B0 as program memory, instructions can be downloaded from external program memory into on-chip RAM and then executed.

When using on-chip program RAM, ROM, EPROM, or high-speed external program memory, the TMS320C2x runs at full speed without wait states. However, the READY line can be used to interface the TMS320C2x to slower, less-expensive external memory. Downloading programs from slow off-chip memory to on-chip program RAM speeds processing while cutting system costs.

The TMS320C2x provides three separate address spaces for program memory, data memory, and I/O. The on-chip memory is mapped into either the 64K-word data memory or program memory space, depending upon the memory configuration (see Figure 1). The CNFD (configure block B0 as data memory) and CNFP (configure block B0 as program memory) instructions allow dynamic configuration of the memory maps through software. Regardless of the configuration, the user may still execute from external program memory.

The TMS320C2x has six registers that are mapped into the data memory space: a serial port data receive register, serial port data transmit register, timer register, period register, interrupt mask register, and global memory allocation register.

TMS320 SECOND-GENERATION DEVICES

SPRS010B — MAY 1987 — REVISED NOVEMBER 1990

(a) Memory Maps After a CNFD Instruction

(b) Memory Maps After a CNFP Instruction

Figure 1. Memory Maps

interrupts and subroutines

The TMS320C2x has three external maskable user interrupts $\overline{\text{INT2}}$ - $\overline{\text{INT0}}$, available for external devices that interrupt the processor. Internal interrupts are generated by the serial port (RINT and XINT), by the timer (TINT), and by the software interrupt (TRAP) instruction. Interrupts are prioritized with reset ($\overline{\text{RS}}$) having the highest priority and the serial port transmit interrupt (XINT) having the lowest priority. All interrupt locations are on two-word boundaries so that branch instructions can be accommodated in those locations if desired.

A built-in mechanism protects multicycle instructions from interrupts. If an interrupt occurs during a multicycle instruction, the interrupt is not processed until the instruction is completed. This mechanism applies to instructions that are repeated and to instructions that become multicycle due to the READY signal.

external interface

The TMS320C2x supports a wide range of system interfacing requirements. Program, data, and I/O address spaces provide interface to memory and I/O, thus maximizing system throughput. I/O design is simplified by having I/O treated the same way as memory. I/O devices are mapped into the I/O address space using the processor's external address and data buses in the same manner as memory-mapped devices. Interface to memory and I/O devices of varying speeds is accomplished by using the READY line. When transactions are made with slower devices, the TMS320C2x processor waits until the other device completes its function and signals the processor via the READY line. Then, the TMS320C2x continues execution.

A full-duplex serial port provides communication with serial devices, such as codecs, serial A/D converters, and other serial systems. The interface signals are compatible with codecs and many other serial devices with a minimum of external hardware. The serial port may also be used for intercommunication between processors in multiprocessing applications.

The serial port has two memory-mapped registers: the data transmit register (DXR) and the data receive register (DRR). Both registers operate in either the byte mode or 16-bit word mode, and may be accessed in the same manner as any other data memory location. Each register has an external clock, a framing synchronization pulse, and associated shift registers. One method of multiprocessing may be implemented by programming one device to transmit while the others are in the receive mode. The serial port on the TMS320C25 is double-buffered and fully static.

multiprocessing

The flexibility of the TMS320C2x allows configurations to satisfy a wide range of system requirements and can be used as follows:

- A standalone processor
- A multiprocessor with devices in parallel
- A slave/host multiprocessor with global memory space
- A peripheral processor interfaced via processor-controlled signals to another device.

For multiprocessing applications, the TMS320C2x has the capability of allocating global data memory space and communicating with that space via the BR (bus request) and READY control signals. Global memory is data memory shared by more than one processor. Global data memory access must be arbitrated. The 8-bit memory-mapped GREG (global memory allocation register) specifies part of the TMS320C2x's data memory as global external memory. The contents of the register determine the size of the global memory space. If the current instruction addresses an operand within that space, BR is asserted to request control of the bus. The length of the memory cycle is controlled by the READY line.

The TMS320C2x supports DMA (direct memory access) to its external program/data memory using the $\overline{\text{HOLD}}$ and HOLDA signals. Another processor can take complete control of the TMS320C2x's external memory by asserting HOLD low. This causes the TMS320C2x to place its address data and control lines in a high-impedance state, and assert HOLDA. On the TMS320C2x, program execution from on-chip ROM may proceed concurrently when the device is in the hold mode.

instruction set

The TMS320C2x microprocessor implements a comprehensive instruction set that supports both numeric-intensive signal processing operations as well as general-purpose applications, such as multiprocessing and high-speed control. The TMS32020 source code is upward-compatible with TMS320C25 source code. TMS32020 object code runs directly on the TMS320C25.

For maximum throughput, the next instruction is prefetched while the current one is being executed. Since the same data lines are used to communicate to external data/program or I/O space, the number of cycles may vary depending upon whether the next data operand fetch is from internal or external memory. Highest throughput is achieved by maintaining data memory on-chip and using either internal or fast external program memory.

addressing modes

The TMS320C2x instruction set provides three memory addressing modes: direct, indirect, and immediate addressing.

Both direct and indirect addressing can be used to access data memory. In direct addressing, seven bits of the instruction word are concatenated with the nine bits of the data memory page pointer to form the 16-bit data memory address. Indirect addressing accesses data memory through the auxiliary registers. In immediate addressing, the data is based on a portion of the instruction word(s).

In direct memory addressing, the instruction word contains the lower seven bits of the data memory address. This field is concatenated with the nine bits of the data memory page pointer to form the full 16-bit address. Thus, memory is paged in the direct addressing mode with a total of 512 pages, each page containing 128 words.

Up to eight auxiliary registers (AR0-AR7) provide flexible and powerful indirect addressing (five on the TMS32020, eight on the TMS320C25). To select a specific auxiliary register, the Auxiliary Register Pointer (ARP) is loaded with a value from 0 to 7 for AR0 through AR7, respectively.

There are seven types of indirect addressing: auto-increment or auto-decrement, post-indexing by either adding or subtracting the contents of AR0, single indirect addressing with no increment or decrement, and bit-reversal addressing (used in FFTs on the TMS320C25 only) with increment or decrement. All operations are performed on the current auxiliary register in the same cycle as the original instruction, following which the current auxiliary register and ARP may be modified.

repeat feature

A repeat feature, used with instructions such as multiply/accumulates, block moves, I/O transfers, and table read/writes, allows a single instruction to be performed up to 256 times. The repeat counter (RPTC) is loaded with either a data memory value (RPT instruction) or an immediate value (RPTK instruction). The value of this operand is one less than the number of times that the next instruction is executed. Those instructions that are normally multicycle are pipelined when using the repeat feature, and effectively become single-cycle instructions.

instruction set summary

Table 2 lists the symbols and abbreviations used in Table 3, the TMS320C25 instruction set summary. Table 3 consists primarily of single-cycle, single-word instructions. Infrequently used branch, I/O, and CALL instructions are multicyle. The instruction set summary is arranged according to function and alphabetized within each functional grouping. The symbol (†) indicates those instructions that are not included in the TMS320C1x instruction set. The symbol (‡) indicates instructions that are not included in the TMS32020 instruction set.

Table 2. Instruction Symbols

SYMBOL	DEFINITION
B	4-bit field specifying a bit code
CM	2-bit field specifying compare mode
D	Data memory address field
FO	Format status bit
I	Addressing mode bit
K	Immediate operand field
PA	Port address (PA0 through PA15 are predefined assembler symbols equal to 0 through 15, respectively.)
PM	2-bit field specifying P register output shift code
AR	3-bit operand field specifying auxiliary register
S	4-bit left-shift code
X	3-bit accumulator left-shift field

Table 3. TMS320C25 Instruction Set Summary

ACCUMULATOR MEMORY REFERENCE INSTRUCTIONS															
MNEMONIC	DESCRIPTION	NO. WORDS	INSTRUCTION BIT CODE												
			15	14	13	12	11	10	9	8	7	6	5	4	3
ABS	Absolute value of accumulator	1	1	1	0	0	1	1	1	0	0	0	0	1	1

RET	Return from subroutine	1	1	1	0	0	1	1	1	0	0	0	1	0	0	1
I/O AND DATA MEMORY OPERATIONS																
MNEMONIC	DESCRIPTION	NO. WORDS	INSTRUCTION BIT CODE													
			15	14	13	12	11	10	9	8	7	6	5	4	3	2
BLKD [†]	Block move from data memory to data memory	2	1	1	1	0	1	1	0	1	1	1	1	1	1	1
BLKP [†]	Block move from program memory to data memory	2	1	1	1	1	1	1	0	0	1	1	1	1	1	1
DMOV	Data move in data memory	1	0	1	0	1	0	1	1	0	1	1	1	1	1	1
FORT [†]	Format serial port registers	1	1	1	0	0	1	1	1	0	0	0	0	0	1	1
IN	Input data from port	1	1	0	0	0	1	1	1	0	0	1	1	1	1	1
OUT	Output data to port	1	1	1	1	0	1	1	1	0	0	1	1	1	1	1
RFSM [‡]	Reset serial port frame synchronization mode	1	1	1	0	0	1	1	1	0	0	0	1	1	0	1
RTXM [†]	Reset serial port transmit mode	1	1	1	0	0	1	1	1	0	0	0	1	0	0	0
RXF [†]	Reset external flag	1	1	1	0	0	1	1	1	0	0	0	0	0	1	1
SFSM [‡]	Set serial port frame synchronization mode	1	1	1	0	0	1	1	1	0	0	0	1	1	0	1
STXM [†]	Set serial port transmit mode	1	1	1	0	0	1	1	1	0	0	0	1	0	0	0
SXF [†]	Set external flag	1	1	1	0	0	1	1	1	0	0	0	0	0	1	1
TBLR	Table read	1	0	1	0	1	1	0	0	0	1	1	1	1	1	1
TBLW	Table write	1	0	1	0	1	1	0	0	1	1	1	1	1	1	1

[†] These instructions are not included in the TMS320C1x instruction set.

[‡] These instructions are not included in the TMS32020 instruction set.

Table 3. TMS320C25 Instruction Set Summary (concluded)

CONTROL INSTRUCTIONS																			
MNEMONIC	DESCRIPTION	NO. WORDS	INSTRUCTION BIT CODE																
			15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
BIT [†]	Test bit	1	1	0	0	1	← B →		I	← D →									
BITT [†]	Test bit specified by T register	1	0	1	0	1	0	1	1	1	I	← D →							
CNFD [†]	Configure block as data memory	1	1	1	0	0	1	1	1	0	0	0	0	0	0	1	0	0	
CNFP [†]	Configure block as program memory	1	1	1	0	0	1	1	1	0	0	0	0	0	0	1	0	1	
DINT	Disable interrupt	1	1	1	0	0	1	1	1	0	0	0	0	0	0	0	0	1	
EINT	Enable interrupt	1	1	1	0	0	1	1	1	0	0	0	0	0	0	0	0	0	
IDLE [†]	Idle until interrupt	1	1	1	0	0	1	1	1	0	0	0	0	1	1	1	1	1	
LST	Load status register ST0	1	0	1	0	1	0	0	0	0	I	← D →							
LST1 [†]	Load status register ST1	1	0	1	0	1	0	0	0	1	I	← D →							
NOP	No operation	1	0	1	0	1	0	1	0	1	0	0	0	0	0	0	0	0	
POP	Pop top of stack to low accumulator	1	1	1	0	0	1	1	1	0	0	0	0	1	1	1	0	1	
POPD [†]	Pop top of stack to data memory	1	0	1	1	1	1	0	1	0	I	← D →							
PSHD [†]	Push data memory value onto stack	1	0	1	0	1	0	1	0	0	I	← D →							
PUSH	Push low accumulator onto stack	1	1	1	0	0	1	1	1	0	0	0	0	1	1	1	0	0	
RC [‡]	Reset carry bit	1	1	1	0	0	1	1	1	0	0	0	1	1	0	0	0	0	
RHM [‡]	Reset hold mode	1	1	1	0	0	1	1	1	0	0	0	1	1	1	0	0	0	
ROVM	Reset overflow mode	1	1	1	0	0	1	1	1	0	0	0	0	0	0	0	1	0	
RPT [†]	Repeat instruction as specified by data memory value	1	0	1	0	0	1	0	1	1	I	← D →							
RPTK [†]	Repeat instruction as specified by immediate value	1	1	1	0	0	1	0	1	1	← K →								
RSXM [†]	Reset sign-extension mode	1	1	1	0	0	1	1	1	0	0	0	0	0	0	1	1	0	
RTC [‡]	Reset test/control flag	1	1	1	0	0	1	1	1	0	0	0	1	1	0	0	1	0	
SC [‡]	Set carry bit	1	1	1	0	0	1	1	1	0	0	0	1	1	0	0	0	1	
SHM [‡]	Set hold mode	1	1	1	0	0	1	1	1	0	0	0	1	1	1	0	0	1	
SOVM	Set overflow mode	1	1	1	0	0	1	1	1	0	0	0	0	0	0	0	1	1	
SST	Store status register ST0	1	0	1	1	1	1	0	0	0	I	← D →							
SST1 [†]	Store status register ST1	1	0	1	1	1	1	0	0	1	I	← D →							
SSXM [†]	Set sign-extension mode	1	1	1	0	0	1	1	1	0	0	0	0	0	0	1	1	1	
STC [‡]	Set test/control flag	1	1	1	0	0	1	1	1	0	0	0	1	1	0	0	1	1	
TRAP [†]	Software interrupt	1	1	1	0	0	1	1	1	0	0	0	0	1	1	1	1	0	

[†] These instructions are not included in the TMS320C1x instruction set.

[‡] These instructions are not included in the TMS32020 instruction set.

TMS32020 PRODUCT NOTIFICATION

Texas Instruments has identified an unusual set of circumstances that will cause the BIT (Test Bit) instruction on the TMS32020 to affect the contents of the accumulator; ideally, the BIT instruction should not affect the accumulator. This set of conditions is:

1. The overflow mode is set (the OVM status register bit is set to one.)
2. And, the two LSBs of the BIT instruction opcode word are zero.
 - a. When direct memory addressing is used, every fourth data word is affected; all other locations are not affected.
 - b. When indirect addressing is used, the two LSBs will be zero if a new ARP is not selected or if a new ARP is selected and that ARP is 0 or 4.
3. And, adding the contents of the accumulator with the contents of the addressed data memory location, shifted by 2 (bit code), causes an overflow of the accumulator.

If all of these conditions are met, the contents of the accumulator will be replaced by the positive or negative saturation value, depending on the polarity of the overflow.

Various methods for avoiding this phenomenon are available:

- If the TMS32020 is not in the saturation mode when the BIT instruction is executed, the device operates properly and the accumulator is not affected.
- Execute the Reset Overflow Mode (ROVM) instruction immediately prior to the BIT instruction and the Set Overflow Mode (SOVM) instruction immediately following the BIT instruction.
- If direct memory addressing is being used during the BIT instructions, reorganize memory so that the page relative locations 0, 4, 8, C, 10 . . . are not used.
- If indirect addressing is being used during the Bit instruction, select a new ARP which is not AR0 or AR4. If necessary, follow the instruction with a LARP AR0 or LARP AR4 to restore the code.
- Use the Test Bit Specified by T Register (BITT) instruction instead of the BIT instruction. The BITT instruction operates correctly and will not affect the accumulator under any circumstances.
- Replace TMS32020 with TMS320C25 for ideal pin-to-pin and object-code compatibility. The BIT instruction on the TMS320C25 executes properly and will not affect the accumulator under any circumstances.

development support

Together, Texas Instruments and its authorized third-party suppliers offer an extensive line of development support products to assist the user in all aspects of TMS320 second-generation-based design and development. These products range from development and application software to complete hardware development and evaluation systems. Table 4 lists the development support products for the second-generation TMS320 devices.

System development may begin with the use of the simulator, Software Development System (SWDS), or emulator (XDS) along with an assembler/linker. These tools give the TMS320 user various means of evaluation, from software simulation of the second-generation TMS320s (simulator) to full-speed in-circuit emulation with hardware and software breakpoint trace and timing capabilities (XDS).

Software and hardware can be developed simultaneously by using the macro assembler/linker, C compiler, and simulator for software development, the XDS for hardware development, and the Software Development System for both software development and limited hardware development.

Many third-party vendors offer additional development support for the second-generation TMS320s, including assembler/linkers, simulators, high-level languages, applications software, algorithm development tools, application boards, software development boards, and in-circuit emulators. Refer to the *TMS320 Family Development Support Reference Guide* (SPRU011A) for further information about TMS320 development support products offered by both Texas Instruments and its third-party suppliers.

Additional support for the TMS320 products consists of an extensive library or product and applications documentation. Three-day DSP design workshops are offered by the TI Regional Technology Centers (RTCs). These workshops provide insight into the architecture and the instruction set of the second-generation TMS320s as well as hands-on training with the TMS320 development tools. When technical questions arise regarding the TMS320 family, contact the Texas Instruments TMS320 Hotline at (713) 274-2320. Or, keep informed on the latest TI and third-party development support tools by accessing the DSP Bulletin Board Service (BBS) at (713) 274-2323. The BBS serves 2400-, 1200- and 300-bps modems. Also, TMS320 application source code may be downloaded from the BBS.

TMS320 SECOND-GENERATION DEVICES

SPRS010B — MAY 1987 — REVISED NOVEMBER 1990

documentation support

Extensive documentation supports the second-generation TMS320 devices from product announcement through applications development. The types of documentation include data sheets with design specifications, complete user's guides, and 750 pages of application reports published in the book, *Digital Signal Processing Applications with the TMS320 Family* (SPRA012A). An application report, *Hardware Interfacing to the TMS320C25* (SPRA014A), is available for that device.

A series of DSP textbooks is being published by Prentice-Hall and John Wiley & Sons to support digital signal processing research and education. The TMS320 newsletter, *Details on Signal Processing*, is published quarterly and distributed to update TMS320 customers on product information. The TMS320 DSP bulletin board service provides access to large amounts of information pertaining to the TMS320 family.

Refer to the *TMS320 Family Development Support Reference Guide* (SPRU011A) for further information about TMS320 documentation. To receive copies of second-generation TMS320 literature, call the Customer Response Center at 1-800-232-3200.

specification overview

The electrical specifications for the TMS32020, TMS320C25, TMS320E25, and TMS320C25-50 are given in the following pages. Note that the electrical specifications for the TMS320E25 are identical to those for the TMS320C25, with the addition of EPROM-related specifications. A summary of differences between TMS320C25 and TMS320C25-50 specifications immediately follows the TMS320C25-50 specification.

absolute maximum ratings over specified temperature range (unless otherwise noted)†

Supply voltage range, $V_{CC}^{\ddagger}$	– 0.3 V to 7 V
Input voltage range	– 0.3 V to 7 V
Output voltage range	– 0.3 V to 7 V
Continuous power dissipation	2 W
Operating free-air temperature range	0°C to 70°C
Storage temperature range	– 55°C to 150°C

† Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the “Recommended Operating Conditions” section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

‡ All voltage values are with respect to V_{SS} .

recommended operating conditions

			MIN	NOM	MAX	UNIT
V _{CC}	Supply voltage		4.75	5	5.25	V
V _{SS}	Supply voltage		0			V
V _{IH}	High-level input voltage	All inputs except CLKIN	2	V _{CC} + 0.3		V
		CLKIN	2.4	V _{CC} + 0.3		V
V _{IL}	Low-level input voltage	All inputs except CLKIN	– 0.3	0.8		V
		CLKIN	– 0.3	0.8		V
I _{OH}	High-level output current		300			μA
I _{OL}	Low-level output current		2			mA
T _A	Operating free-air temperature (see Notes 1 and 2)		0	70		°C

NOTES: 1. Case temperature (T_C) must be maintained below 90°C.

2. $R_{\theta JA} = 36^\circ\text{C/Watt}$, $R_{\theta JC} = 6^\circ\text{C/Watt}$.

electrical characteristics over specified free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP [§]	MAX	UNIT
V _{OH}	High-level output voltage	V _{CC} = MIN, I _{OH} = MAX	2.4	3		V

I _I	Input current	V _I = V _{SS} to V _{CC}	–10		10	μA
I _{CC}	Supply current	T _A = 0°C, V _{CC} = MAX, f _X = MAX			360	mA
		T _A = 25°C, V _{CC} = MAX, f _X = MAX		250		mA
		T _C = 90°C, V _{CC} = MAX, f _X = MAX			285	mA
C _I	Input capacitance				15	pF
C _O	Output capacitance				15	pF

§ All typical values for I_{CC} are at $V_{CC} = 5$ V, $T_A = 25^\circ\text{C}$.

This device contains circuits to protect its inputs and outputs against damage due to high static voltages or electrostatic fields. These circuits have been qualified to protect this device against electrostatic discharges (ESD) of up to 2 kV according to MIL-STD-883C, Method 3015; however, it is advised that precautions should be taken to avoid application of any voltage higher than maximum-rated voltages to these high-impedance circuits. During storage or handling, the device leads should be shorted together or the device should be placed in conductive foam. In a circuit, unused inputs should always be connected to an appropriated logic voltage level, preferably either V_{CC} or ground. Specific guidelines for handling devices of this type are contained in the publication *Guidelines for Handling Electrostatic-Discharge-Sensitive (ESDS) Devices and Assemblies* available from Texas Instruments.

CLOCK CHARACTERISTICS AND TIMING

The TMS32020 can use either its internal oscillator or an external frequency source for a clock.

internal clock option

The internal oscillator is enabled by connecting a crystal across X1 and X2/CLKIN (see Figure 2). The frequency of CLKOUT1 is one-fourth the crystal fundamental frequency. The crystal should be fundamental mode, and parallel resonant, with an effective series resistance of 30 Ω , a power dissipation of 1 mW, and be specified at a load capacitance of 20 pF.

PARAMETER	TEST CONDITIONS	MIN	TYP [†]	MAX	UNIT
f_x Input clock frequency	$T_A = 0^\circ\text{C to } 70^\circ\text{C}$	6.7		20.5	MHz
f_{XS} Serial port frequency	$T_A = 0^\circ\text{C to } 70^\circ\text{C}$	50 [†]		2563	MHz
C1, C2	$T_A = 0^\circ\text{C to } 70^\circ\text{C}$		10		pF

[†] Value derived from characterization data; minimum f_{SX} at test = 825 kHz.

Figure 2. Internal Clock Option

external clock option

An external frequency source can be used by injecting the frequency directly into X2/CLKIN with X1 left unconnected. The external frequency injected must conform to the specifications listed in the following table.

switching characteristics over recommended operating conditions (see Note 3)

PARAMETER	MIN	NOM	MAX	UNIT
$t_{c(C)}$ CLKOUT1/CLKOUT2 cycle time	195		597	ns

[§] All typical values are at $V_{CC} = 5 \text{ V}$, $T_A = 25^\circ$.

Caution. This device contains circuits to protect its inputs and outputs against damage due to high static voltages or electrostatic fields. These circuits have been qualified to protect this device against electrostatic discharges (ESD) of up to 2 kV according to MIL-STD-883C, Method 3015; however, it is advised that precautions be taken to avoid application of any voltage higher than maximum rated voltages to these high-impedance circuits. During storage or handling, the device leads should be shorted together or the device should be placed in conductive foam. In a circuit, unused inputs should always be connected to an appropriate logic voltage level, preferably either V_{CC} or ground. Specific guidelines for handling devices of this type are contained in the publication “Guidelines for Handling Electrostatic-Discharge Sensitive (ESDS) Devices and Assemblies” available from Texas Instruments

CLOCK CHARACTERISTICS AND TIMING

The TMS32025 can use either its internal oscillator or an external frequency source for a clock.

internal clock option

The internal oscillator is enabled by connecting a crystal across X1 and X2/CLKIN (see Figure 2). The frequency of CLKOUT1 is one-fourth the crystal fundamental frequency. The crystal should be either fundamental or overtone mode, and parallel resonant, with an effective series resistance of 30 Ω , a power dissipation of 1 mW, and be specified at a load capacitance of 20 pF. Note that overtone crystals require an additional tuned LC circuit; see the application report, *Hardware Interfacing to the TMS320C25* (SPRA014A).

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_x Input clock frequency	$T_A = 0^\circ\text{C to } 70^\circ\text{C}$	6.7		40.96	MHz
f_{XS} Serial port frequency	$T_A = 0^\circ\text{C to } 70^\circ\text{C}$	0 [†]		5120	MHz
C1, C2	$T_A = 0^\circ\text{C to } 70^\circ\text{C}$		10		pF

[†] The serial port was tested at a minimum frequency of 1.25 MHz. However, the serial port was fully static but will properly function down to $f_{SX} = 0$ Hz.

Figure 2. Internal Clock Option

external clock option

An external frequency source can be used by injecting the frequency directly into X2/CLKIN with X1 left unconnected. The external frequency injected must conform to the specifications listed in the following table.

switching characteristics over recommended operating conditions (see Note 3)

PARAMETER	MIN	TYP	MAX	UNIT
$t_{c(C)}$ CLKOUT1/CLKOUT2 cycle time	97.7		597	ns
$t_{d(CIH-C)}$ CLKIN high to CLKOUT1/CLKOUT2/STRB high/low	5		30	ns
$t_f(C)$ CLKOUT1/CLKOUT2/STRB fall time			5	ns
$t_r(C)$ CLKOUT1/CLKOUT2/STRB rise time			5	ns

$t_{dis}(C1L-A)$ Address three-state after CLKOUT1 low ($\overline{HOLD}$ mode, see Note 9)			20 [†]	ns
$t_d(HH-AH)$ $\overline{HOLD}$ high to $\overline{HOLDA}$ high			25	ns
$t_{en}(A-C1L)$ Address driven before CLKOUT1 low ($\overline{HOLD}$ mode, see Note 9)			8 [†]	ns

[†] Value derived from characterization data and not tested.NOTES: 3. $Q = 1/4t_{c(C)}$.

9. A15-A0, $\overline{PS}$, $\overline{DS}$, $\overline{IS}$, $\overline{STRB}$, and $R/\overline{W}$ timings are all included in timings referenced as "address."

timing requirements over recommended operating conditions (see Note 3)

	MIN	NOM	MAX	UNIT
$t_d(C2H-H)$ $\overline{HOLD}$ valid after CLKOUT2 high			Q – 24	ns

NOTE 3: $Q = 1/4t_{c(C)}$.

SERIAL PORT TIMING

switching characteristics over recommended operating conditions (see Note 3)

PARAMETER	MIN	TYP	MAX	UNIT
$t_d(\text{CH-DX})$ DX valid after CLKX rising edge (see Note 10)			75	ns
$t_d(\text{FL-DX})$ DX valid after FSX falling edge (TXM = 0, see Note 10)			40	ns
$t_d(\text{CH-FS})$ FSX valid after CLKX rising edge (TXM = 1)			40	ns

NOTES: 3. $Q = 1/4t_c(C)$.

10. The last occurrence of FSX falling and CLKX rising.

timing requirements over recommended operating conditions (see Note 3)

	MIN	NOM	MAX	UNIT
$t_c(\text{SCK})$ Serial port clock (CLKX/CLKR) cycle time [†]	200			ns
$t_f(\text{SCK})$ Serial port clock (CLKX/CLKR) fall time			25 [‡]	ns
$t_r(\text{SCK})$ Serial port clock (CLKX/CLKR) rise time			25 [‡]	ns
$t_w(\text{SCK})$ Serial port clock (CLKX/CLKR) low pulse duration (see Note 11)	80			ns
$t_w(\text{SCK})$ Serial port clock (CLKX/CLKR) high pulse duration (see Note 11)	80			ns
$t_{su}(\text{FS})$ FSX/FSR setup time before CLKX/CLKR falling edge (TXM = 0)	18			ns
$t_h(\text{FS})$ FSX/FSR hold time after CLKX/CLKR falling edge (TXM = 0)	20			ns
$t_{su}(\text{DR})$ DR setup time before CLKR falling edge	10			ns
$t_h(\text{DR})$ DR hold time after CLKR falling edge	20			ns

[†] The serial port was tested at a minimum frequency of 1.25 MHz. However, the serial port was fully static but will properly function down to $f_{sx} = 0$ Hz.

[‡] Value derived from characterization data and not tested.

NOTES: 3. $Q = 1/4t_c(C)$.

11. The duty cycle of the serial port clock must be within 40-60%.

EPROM PROGRAMMING

absolute maximum ratings over specified temperature range (unless otherwise noted)[†]

Supply voltage range, V_{PP} [‡]	– 0.6 V to 15 V
Input voltage range on pins 24 and 25	– 0.3 V to 15 V

[†] Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

[‡] All voltage values are with respect to GND.

recommended operating conditions

	MIN	NOM	MAX	UNIT
V_{CC} Programming mode supply voltage (see Note 13)		6		V
V_{CC} Read mode supply voltage	4.75	5	5.25	V
V_{PP} Programming mode supply voltage	12	12.5	13	V
V_{PP} Read mode supply voltage (see Note 12)		V_{CC}		V

NOTES: 12. V_{PP} can be connected to V_{CC} directly (except in the program mode). V_{CC} supply current in this case would be $I_{CC} + I_{PP}$. During programming, V_{PP} must be maintained at 12.5 V (± 0.25 V).

13. V_{CC} must be applied before or at the same time as V_{PP} and removed after or at the same time as V_{PP} . This device must not be inserted into or removed from the board when V_{PP} or V_{CC} is applied.

electrical characteristics over specified temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP [§]	MAX	UNIT
I_{PP1} V_{PP} supply current	$V_{PP} = V_{CC} = 5.25$ V			100	μ A
I_{PP2} V_{PP} supply current (during program pulse)	$V_{PP} = 13$ V		30	50	mA

[§] All typical values for I_{CC} are at $V_{CC} = 5$ V, $T_A = 25^\circ\text{C}$.

recommended timing requirements for programming, $T_A = 25^\circ\text{C}$, $V_{CC} = 6$ V, $V_{PP} = 12.5$ V (see Notes 14 and 15)

	MIN	NOM	MAX	UNIT
$t_{W(IPGM)}$ Initial program pulse duration	0.95	1	1.05	ms
$t_{W(FPGM)}$ Final pulse duration	2.85		78.75	ms
$t_{su(A)}$ Address setup time	2			μ s
$t_{su(E)}$ $\bar{E}$ setup time	2			μ s
$t_{su(G)}$ $\bar{G}$ setup time	2			μ s
$t_{dis(G)}$ Output disable time from $\bar{G}$	0		130 [¶]	ns
$t_{en(G)}$ Output enable time from $\bar{G}$			150 [¶]	ns
$t_{su(D)}$ Data setup time	2			μ s
$t_{su(VPP)}$ V_{PP} setup time	2			μ s
$t_{su(VCC)}$ V_{CC} setup time	2			μ s
$t_h(A)$ Address hold time	0			μ s
$t_h(D)$ Data hold time	2			μ s

[¶] Value derived from characterization data and not tested.

NOTES: 14. For all switching characteristics and timing measurements, input pulse levels are 0.4 V to 2.4 V and $V_{PP} = 12.5$ V ± 0.5 V during programming.

15. Common test conditions apply for $t_{dis(G)}$ except during programming.

absolute maximum ratings over specified temperature range (unless otherwise noted)[†]

Supply voltage range, V_{CC} [‡]	– 0.3 V to 7 V
Input voltage range	– 0.3 V to 7 V
Output voltage range	– 0.3 V to 7 V
Continuous power dissipation	1.5 W
Operating free-air temperature range	0°C to 70°C
Storage temperature range	– 55°C to 150°C

[†] Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the “Recommended Operating Conditions” section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

[‡] All voltage values are with respect to V_{SS} .

recommended operating conditions

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	4.75	5	5.25	V
V_{SS}	Supply voltage		0		V
V_{IH}	High-level input voltage	INT0-INT2		2.5	V
		CLKIN, CLKX, CLKR		3.5	V
		Other inputs		2.35	V
V_{IL}	Low-level input voltage	MP/MC		0.8	V
		CLKIN		0.8	V
		Other inputs		0.8	V

I _Z	High-impedance current		V _{CC} = MAX	– 20		20	μA	
I _I	Input current		V _I = V _{SS} to V _{CC}	– 10		10	μA	
I _{CC}	Supply current	Normal	T _A = 0°C, V _{CC} = MAX, f _x = MAX		110	185	mA	
		Idle, HOLD			50	100		
C _I	Input capacitance					15		pF
C _O	Output capacitance					15		pF

[§] All typical values are at $V_{CC} = 5\text{ V}$, $T_A = 25^\circ\text{C}$.

CLOCK CHARACTERISTICS AND TIMING

The TMS320C25-50 can use either its internal oscillator or an external frequency source for a clock.

internal clock option

The internal oscillator is enabled by connecting a crystal across X1 and X2, CLKIN. The frequency of CLKOUT1 is one-fourth the crystal fundamental frequency. The crystal should be in either fundamental or overtone mode, and parallel resonant, with an effective series resistance of 30 Ω , a power dissipation of 1 mW, and be specified at a load capacitance of 20 pF. Note that overtone crystals require an additional tuned LC circuit.

PARAMETER	TEST CONDITIONS	MIN	TYP [†]	MAX	UNIT
f_X Input clock frequency	$T_A = 0^\circ\text{C to } 70^\circ\text{C}$	6.7		51.2	MHz
f_{SX} Serial port frequency	$T_A = 0^\circ\text{C to } 70^\circ\text{C}$	0		6.4	MHz
C1, C2	$T_A = 0^\circ\text{C to } 70^\circ\text{C}$		10		pF

[†] The serial port was tested at a minimum frequency of 1.25 MHz. However, the serial port was fully static but will properly function down to $f_{SX} = 0$ Hz.

Figure 6. Internal Clock Option

external clock option

An external frequency source can be used by injecting the frequency directly into X2/CLK, with X1 left unconnected. The external frequency injected must conform to specifications listed in the following table.

switching characteristics over recommended operating conditions (see Note 3)

	MIN	NOM	MAX	UNIT
$t_{c(C)}$ CLKOUT1, CLKOUT2 cycle time	78.13		597	ns
$t_{d(CIH-C)}$ CLKIN high to CLKOUT1, CLKOUT2, STRB high, low	12		27	ns
$t_{f(C)}$ CLKOUT1, CLKOUT2, $\overline{\text{STRB}}$ fall time			4	ns
$t_{r(C)}$ CLKOUT1, CLKOUT2, $\overline{\text{STRB}}$ rise time			4	ns
$t_{w(CL)}$ CLKOUT1, CLKOUT2, $\overline{\text{STRB}}$ low pulse duration	$2Q - 7$		$2Q + 3$	ns
$t_{w(CH)}$ CLKOUT1, CLKOUT2, $\overline{\text{STRB}}$ high pulse duration	$2Q - 3$		$2Q + 7$	ns
$t_{d(C1-C2)}$ CLKOUT1 high to CLKOUT2 low, CLKOUT2 high to CLKOUT1 high, etc.	$Q - 6$		$Q + 2$	ns

NOTE 3: $Q = 1/4 t_{c(C)}$

Figure 7. External Clock Option

timing requirements over recommended operating conditions (see Note 3)

		MIN	NOM	MAX	UNIT
t _c (CI)	CLKIN cycle time	19.5 3		150	ns
t _f (CI)	CLKIN fall time			5 [†]	ns
t _r (CI)	CLKIN rise time			5 [†]	ns
t _w (CIL)	CLKIN low pulse duration, t _c (CI) = 50 ns (see Note 4)	20			ns
t _w (CIH)	CLKIN high pulse duration, t _c (CI) = 50 ns (see Note 4)	20			ns
t _{su} (S)	$\overline{\text{SYNC}}$ setup time before CLKIN low	4	Q – 4		ns
t _h (S)	$\overline{\text{SYNC}}$ hold time from CLKIN low	4			ns

[†] Value derived from characterization data and not tested.
NOTES: 3. Q = 1/4 t_c(C)
4. CLKIN duty cycle [t_r(CI) + t_w(CIH)]/t_c(CI) must be within 40-60%.

ADVANCE INFORMATION

MEMORY AND PERIPHERAL INTERFACE TIMING

switching characteristics over recommended operating conditions (see Note 3)

PARAMETER	MIN	TYP	MAX	UNIT
$t_{d(C1-S)}$ $\overline{STRB}$ from CLKOUT (if $\overline{STRB}$ is present)	$Q - 5$		$Q + 3$	ns
$t_{d(C2-S)}$ CLKOUT2 to $\overline{STRB}$ (if $\overline{STRB}$ is present)	-2		5	ns
$t_{su(A)}$ Address setup time before $\overline{STRB}$ low (see Note 5)	$Q - 11$			ns
$t_{h(A)}$ Address hold time after $\overline{STRB}$ high (see Note 5)	$Q - 4$			ns
$t_{w(SL)}$ $\overline{STRB}$ low pulse duration (no wait states, see Note 6)	$2Q - 5$		$2Q + 2$	ns
$t_{w(SH)}$ $\overline{STRB}$ high pulse duration (between consecutive cycles, see Note 6)	$2Q - 2$		$2Q + 5^\dagger$	ns
$t_{su(D)W}$ Data write setup time before $\overline{STRB}$ high (no wait)	$2Q - 17$			ns
$t_{h(D)W}$ Data write hold time from $\overline{STRB}$ high	$Q - 5$			ns
$t_{en(D)}$ Data bus starts being driven after $\overline{STRB}$ low (write)	$0^\dagger$			ns
$t_{dis(D)}$ Data bus high-impedance state after $\overline{STRB}$ high, (write)		Q	$Q + 15^\dagger$	ns
$t_{d(MSC)}$ $\overline{MSC}$ valid from CLKOUT1	-1		9	ns

† Value derived from characterization data and not tested.

NOTES: 3. $Q = 1/4 t_{c(C)}$

5. A15-A0, $\overline{PS}$, $\overline{DS}$, $\overline{IS}$, $\overline{R/W}$, and $\overline{BR}$ timings are all included in timings referenced as "address".

6. Delay between CLKOUT1, CLKOUT2, and $\overline{STRB}$ edges track each other, resulting in $t_{w(SL)}$ and $t_{w(SH)}$ being $2Q$ with no wait states.

timing requirements over recommended operating conditions (see Note 3)

	MIN	NOM	MAX	UNIT
$t_{a(A)}$ Read data access time from address time (see Notes 5 and 7)			$3Q - 30$	ns
$t_{su(D)R}$ Data read setup time before $\overline{STRB}$ high	19			ns
$t_{h(D)R}$ Data read hold time from $\overline{STRB}$ high	0			ns

TYPICAL SUPPLY CURRENT CHARACTERISTICS FOR TMS320C25

TMS320C25FNL (PLCC) reflow soldering precautions

Recent tests have identified an industry-wide problem experienced by surface mounted devices exposed to reflow soldering temperatures. This problem involves a package cracking phenomenon sometimes experienced by large (e.g., 68-lead) plastic leaded chip carrier (PLCC) packages during surface mount manufacturing. This phenomenon occurs if the TMS320C25FNL is exposed to uncontrolled levels of humidity prior to reflow solder. This moisture can flash to steam during solder reflow, causing sufficient stress to crack the package and compromise device integrity. If the TMS320C25FNL is being socketed, *no* special handling precautions are required. In addition, once the device is soldered into the board, *no* special handling precautions are required.

In order to minimize moisture absorption, TI ships the TMS320C25FNL in "dry pack" shipping bags with a RH indicator card and moisture-absorbing desiccant. These moisture-barrier shipping bags will adequately block moisture transmission to allow shelf storage for 12 months from date of seal when stored at less than 60% relative humidity (RH) and less than 30°C. Devices may be stored outside the sealed bags indefinitely if stored at less than 25% RH and 30°C.

Once the bag seal is broken, the devices should be stored at less than 60% RH and 30°C as well as reflow soldered within two days of removal. In the event that either of the above conditions is not met, TI recommends these devices be baked in a clean oven at 125°C and 10% maximum RH for 24 hours. This restores the devices to their "dry packed" moisture level.

NOTE

Shipping tubes will not withstand the 125°C baking process. Devices should be transferred to a metal tray or tube before baking. Standard ESD precautions should be followed.

In addition, TI recommends that the reflow process not exceed two solder cycles and the temperature not exceed 220°C.

If you have any additional questions or concerns, please contact your local TI representative.

MECHANICAL DATA

68-pin GB grid array ceramic package (TMS32020, TMS320C25)

ADVANCE INFORMATION

TMS320C25 TMS320C25-50

SPRS010B — MAY 1987 — REVISED NOVEMBER 1990

68-lead plastic leaded chip carrier package (TMS320C25 and TMS320C25-50)

ADVANCE INFORMATION

Thermal Resistance Characteristics

PARAMETER		MAX	UNIT
$R_{\theta JA}$	Junction-to-free-air thermal resistance	46	$^\circ\text{C/W}$
$R_{\theta JC}$	Junction-to-case thermal resistance	11	$^\circ\text{C/W}$

Lead Detail

ALL LINEAR DIMENSIONS ARE IN MILLIMETERS AND PARENTHETICALLY IN INCHES

NOTES: A. Centerline of center pin, each side, is within 0,10 (0.004) of package centerline as determined by this dimension.
B. Location of each pin is within 0,127 (0.005) of true position with respect to center pin on each side.

WARNING

When reflow soldering is required, refer to page 54 for special handling instructions.

68-lead FZ CER-QUAD, ceramic leaded chip carrier package (TMS320E25 only)

The drawing shows the top and side views of the MO-087AA package. The top view is a square with a central circular feature. Dimensions A and B are indicated for the overall width and height, respectively, with a note to see Note 2. A chamfer is shown with a dimension of 1,02 (0.040) x 45°. The side view shows the package height with dimensions 4,57 (0.180) and 3,94 (0.155) for the total height and the height to the seating plane, respectively. Other side view dimensions include 3,55 (0.140) and 3,05 (0.120) for the height to the top of the package, 0,81 (0.032) and 0,66 (0.026) for the height to the bottom of the package, 1,27 (0.050) Typ for the height to the top of the package, 0,51 (0.020) and 0,36 (0.014) for the height to the seating plane, 1,016 (0.040) Min Ref for the height to the seating plane, and 3,05 (0.120) and 2,29 (0.090) for the height to the bottom of the package. The seating plane is indicated by a dashed line and a note to see Note 4. The package has a maximum of 3 places for R, with a dimension of 0,64 (0.025).

Thermal Resistance Characteristics

PARAMETER		MAX	UNIT
$R_{\theta JA}$	Junction-to-free-air thermal resistance	49	$^{\circ}\text{C/W}$
$R_{\theta JC}$	Junction-to-case thermal resistance	8	$^{\circ}\text{C/W}$

JEDEC OUTLINE	NO. OF TERMINALS	A		B		C	
		MIN	MAX	MIN	MAX	MIN	MAX
MO-087AA	28	12,32 (0.485)	12,57 (0.465)	10,92 (0.430)	11,56 (0.455)	10,41 (0.410)	10,92 (0.430)
MO-087AB	44	17,40 (0.685)	17,65 (0.695)	16,00 (0.630)	16,64 (0.655)	15,49 (0.610)	16,00 (0.630)
---	68	25,02 (0.985)	25,27 (0.995)	23,62 (0.930)	24,26 (0.955)	23,11 (0.910)	23,62 (0.930)

ALL LINEAR DIMENSIONS ARE IN MILLIMETERS AND PARENTHETICALLY IN INCHES

NOTES: 1. Glass is optional, and the diameter is dependent on device application.
2. Centerline of center pin, each side, is within 0,10 (0.004) of package centerline as determined by dimension B.
3. Location of each pin is within 0,127 (0.005) of true position with respect to center pin on each side.
4. The lead contact points are within 0.15 (0.006) of being planar.

programming the TMS320E25 EPROM cell

The TMS320E25 includes a $4K \times 16$ -bit EPROM, implemented from an industry-standard EPROM cell, to perform prototyping and early field testing and to achieve low-volume production. When used with a 4K-word masked-ROM TMS320C25, the TMS320E25 yields a high-volume, low-cost production as a result of more migration paths for data. An EPROM adapter socket (part # TMDX3270120), shown in Figure 8, is available to provide 68-pin to 28-pin conversion for programming the TMS320E25.

Figure 8. EPROM Adapter Socket

Key features of the EPROM cell include standard programming and verification. For security against copyright violations, the EPROM cell features an internal protection mechanism to prevent proprietary code from being read. The protection feature can be used to protect reading the EPROM contents. This section describes erasure, fast programming and verification, and EPROM protection and verification.

fast programming and verification

The TMS320E25 EPROM cell is programmed using the same family and device codes as the TMS27C64 $8K \times 8$ -bit EPROM. The TMS27C64 EPROM series are ultraviolet-light erasable, electrically programmable read-only memories, fabricated using HVC MOS technology. The TMS27C64 is pin-compatible with existing 28-pin ROMs and EPROMs. The TMS320E25, like the TMS27C64, operates from a single 5-V supply in the read mode; however, a 12.5-V supply is needed for programming. All programming signals are TTL level. For programming outside the system, existing EPROM programmers can be used. Locations may be programmed singly, in blocks, or at random. When programmed in blocks, the data is loaded into the EPROM cell one byte at a time, the high byte first and the low byte second.

Figure 9 shows the wiring conversion to program the TMS320E25 using the 28-pin pinout of the TMS27C64. The pin nomenclature table provides a description of the TMS27C64 pins. The code to be programmed into the device should be serial mode. The TMS320E25 uses 13 address lines to address the 4K-word memory in byte format.

Pin Nomenclature (TMS320E25)

SIGNALS	I/O	DEFINITION
A12 (MSB) - A0 (LSB)	I	On-chip EPROM programming address lines
CLIN	I	Clock oscillator input
E	I	EPROM chip select
EPT	I	EPROM test mode select
G	I	EPROM read/verify select
GND	I	Ground
PGM	I	EPROM write/program select
Q8 (MSB) - Q1 (LSB)	I/O	Data lines for byte-wide programming of on-chip 8K bytes of EPROM
RS	I	Reset for initializing the device
VCC	I	5-V power supply
VPP	I	12.5-V power supply

Figure 9. TMS320E25 EPROM Conversion to TMS27C64 EPROM Pinout

ADVANCE INFORMATION

Table 5 shows the programming levels required for programming, verifying and reading the EPROM cell. The paragraphs following the table describe the function of each programming level.

Table 5. TMS320E25 Programming Mode Levels

SIGNAL NAME [†]	TMS320E25 PIN	TMS27C64 PIN	PROGRAM	PROGRAM VERIFY	PROGRAM INHIBIT	READ	OUTPUT DISABLE

A4	31	3	ADDR	ADDR	X	ADDR	X
A3-A0	30-28,26	7-10	ADDR	ADDR	X	ADDR	X

[†] In accordance with TMS27C64.

LEGEND:

V_{IH} = TTL high level; V_{IL} = TTL low level; ADDR = byte address bit

$V_{PP} = 12.5\text{ V} \pm 0.5\text{ V}$; $V_{CC} = 5 \pm 0.25\text{ V}$; X = don't care

PULSE = low-going TTL level pulse; D_{IN} = byte to be programmed at ADDR

QOUT = byte stored at ADDR; RBIT = ROM protect bit.

erasure

Before programming, the device is erased by exposing the chip through the transparent lid to high-intensity ultraviolet light (wavelength 2537 Å). The recommended minimum exposure dose (UV-intensity × exposure-time) is 15 W•s/cm². A typical 12 mW/cm², filterless UV lamp will erase the device in 21 minutes. The lamp should be located approximately 2.5 cm above the chip during erasure. After erasure, all bits are in the high state. Note that normal ambient light contains the correct wavelength for erasure. Therefore, when using the TMS320E25, the window should be covered with an opaque label.

fast programming

After erasure (all memory bits in the cell are logic one), logic zeroes are programmed into the desired locations. The fast programming algorithm, shown in Figure 10, is normally used to program the entire EPROM contents, although individual locations may be programmed separately. A programmed logic zero can be erased only by ultraviolet light. Data is presented in parallel (eight bits) on pins Q8-Q1. Once addresses and data are stable, $\overline{PGM}$ is pulsed. The programming mode is achieved when $V_{PP} = 12.5\text{ V}$, $\overline{PGM} = V_{IL}$, $V_{CC} = 6\text{ V}$, $\overline{G} = V_{IH}$, and $\overline{E} = V_{IL}$. More than one TMS320E25 can be programmed when the devices are connected in parallel. Locations can be programmed in any order.

Programming uses two types of programming pulses: prime and final. The length of the prime pulse is 1 ms. After each prime pulse, the byte being programmed is verified. If correct data is read, the final programming pulse is applied; if correct data is not read, an additional 1-ms prime pulse is applied up to a maximum of 15 times. The final programming pulse is 4 ms times the number of prime programming pulses applied. This sequence of programming and verification is performed at $V_{CC} = 6\text{ V}$, and $V_{PP} = 12.5\text{ V}$. When the full fast programming routine is complete, all bits are verified with $V_{CC} = V_{PP} = 5\text{ V}$.

program verify

Programmed bits may be verified with $V_{PP} = 12.5\text{ V}$ when $\overline{G} = V_{IL}$, $\overline{E} = V_{IL}$, and $\overline{PGM} = V_{IH}$. Figure 11 shows the timing for the program and verify operation.

Figure 10. Fast Programming Flowchart

Figure 11. Fast Programming Timing

program inhibit

Programming may be inhibited by maintaining a high level input on the $\overline{E}$ pin or $\overline{PGM}$ pin.

read

The EPROM contents may be read independent of the programming cycle, provided the RBIT (ROM protect bit) has not been programmed. The read is accomplished by setting $\overline{E}$ to zero and pulsing $\overline{G}$ low. The contents of the EPROM location selected by the value on the address inputs appear on Q8-Q1.

output disable

During the EPROM programming process, the EPROM data outputs may be disabled, if desired, by establishing the output disable state. This state is selected by setting the $\overline{G}$ and $\overline{PGM}$ pins high. While output disable is selected, Q8-Q1 are placed in the high-impedance state.

ROM protection and verification

This section describes the code protection feature included in the EPROM cell, which protects code against copyright violations. Table 6 shows the programming levels required for protecting and verifying the EPROM. The paragraphs following the table describe the protect and verify functions.

Table 6. TMS320E25 Protect and Verify EPROM Mode Levels

SIGNAL [†]	TMS320E25 PIN	TMS27C64 PIN	ROM PROTECT	PROTECT VERIFY
$\overline{E}$	22	20	V_{IH}	V_{IL}
$\overline{G}$	42	22	V_{IH}	V_{IL}

A3-A0	30-28, 26	7-10	X	X

[†] In accordance with TMS27C64.

LEGEND;

V_{IH} = TTL high level; V_{IL} = TTL low level; $V_{CC} = 5\text{ V} \pm 0.25\text{ V}$

$V_{PP} = 12.5\text{ V} \pm 0.5\text{ V}$; X = don't care

PULSE = low-going TTL level pulse; RBIT = ROM protect bit.

EPROM protect

The EPROM protect facility is used to completely disable reading of the EPROM contents to guarantee security of proprietary algorithms. This facility is implemented through a unique EPROM cell called the RBIT (EPROM protect bit) cell. Once the contents to be protected are programmed into the EPROM, the RBIT is programmed, disabling access to the EPROM contents and disabling the microprocessor mode on the device. Once programmed, the RBIT can be cleared only by erasing the entire EPROM array with ultraviolet light, thereby maintaining security of the proprietary algorithm. Programming the RBIT is accomplished using the EPROM protect cycle, which consists of setting the $\overline{E}$, $\overline{G}$, $\overline{PGM}$, and A4 pins high, V_{PP} and EPT to $2.5\text{ V} \pm 0.5\text{ V}$, and pulsing Q8 low. The complete sequence of operations involved in programming the RBIT is shown in the flowchart of Figure 12. The required setups in the figure are detailed in Table 6.

Figure 12. EPROM Protect Flowchart

protect verify

Protect verify is used following the EPROM protect to verify correct programming of the RBIT (see Figure 12). When using protect verify, Q8 outputs the state of the RBIT. When RBIT = 1, the EPROM is unprotected; when RBIT = 0, the EPROM is protected. The EPROM protect and verify timings are shown in Figure 13.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
