

High-Linearity, 1700MHz to 3000MHz Upconversion/ Downconversion Mixer with LO Buffer/Switch

MAX2041

General Description

The MAX2041 high-linearity passive upconverter or downconverter mixer is designed to provide 7.4dB NF and a 7.2dB conversion loss for an RF frequency range of 1700MHz to 3000MHz to support UMTS/WCDMA, DCS, PCS, and WiMAX base-station transmitter or receiver applications. The IIP3 is typically +33.5dBm for both downconversion and upconversion operation. With an LO frequency range of 1900MHz to 3000MHz, this particular mixer is ideal for high-side LO injection architectures. (For a pin-compatible mixer meant for low-side LO injection, refer to the MAX2039.)

In addition to offering excellent linearity and noise performance, the MAX2041 also yields a high level of component integration. This device includes a double-balanced passive mixer core, a dual-input LO selectable switch, and an LO buffer. On-chip baluns are also integrated to allow for a single-ended RF input for downconversion (or RF output for upconversion), and single-ended LO inputs. The MAX2041 requires a nominal LO drive of 0dBm, and supply current is guaranteed to be below 145mA.

The MAX2041 is pin compatible with the MAX2031 815MHz to 995MHz mixer, making this family of passive upconverters and downconverters ideal for applications where a common PC board layout is used for both frequency bands.

The MAX2041 is available in a compact 20-pin thin QFN package (5mm x 5mm) with an exposed paddle. Electrical performance is guaranteed over the extended -40°C to +85°C temperature range.

Applications

UMTS/WCDMA Base Stations
DCS 1800/PCS 1900 EDGE Base Stations
cdmaOne™ and cdma2000® Base Stations
WiMAX Base Stations and Customer Premise Equipment
PHS/PAS Base Stations
Predistortion Receivers
Fixed Broadband Wireless Access
Wireless Local Loop
Private Mobile Radio
Military Systems
Microwave Links
Digital and Spread-Spectrum Communication Systems

cdmaOne is a trademark of CDMA Development Group.

cdma2000 is a registered trademark of Telecommunications Industry Association.

Features

- ◆ 1700MHz to 3000MHz RF Frequency Range
- ◆ 1900MHz to 3000MHz LO Frequency Range
- ◆ 1500MHz to 2000MHz LO Frequency Range (MAX2039)
- ◆ DC to 350MHz IF Frequency Range
- ◆ 7.2dB Conversion Loss
- ◆ +33.5dBm Input IP3
- ◆ +23.3dBm Input 1dB Compression Point
- ◆ 7.4dB Noise Figure
- ◆ Integrated LO Buffer
- ◆ Integrated RF and LO Baluns
- ◆ Low -3dBm to +3dBm LO Drive
- ◆ Built-In SPDT LO Switch with 43dB LO1 to LO2 Isolation and 50ns Switching Time
- ◆ Pin Compatible with the MAX2031 815MHz to 995MHz Mixer
- ◆ External Current-Setting Resistor Provides Option for Operating Mixer in Reduced-Power/Reduced-Performance Mode
- ◆ Lead-Free Package Available

Pin Description

PIN	NAME	FUNCTION
1, 6, 8, 14	VCC	Power-Supply Connection. Bypass each VCC pin to GND with capacitors as shown in the <i>Typical Application Circuit</i> .
2	RF	Single-Ended 50Ω RF Input/Output. This port is internally matched and DC shorted to GND through a balun.
3	TAP	Center Tap of the Internal RF Balun. Bypass to GND with capacitors close to the IC, as shown in the <i>Typical Application Circuit</i> .
4, 5, 10, 12, 13, 16, 17, 20	GND	Ground
7	LOBIAS	Bias Resistor for Internal LO Buffer. Connect a 549Ω ±1% resistor from LOBIAS to the power supply.
9	LOSEL	Local Oscillator Select. Logic control input for selecting LO1 or LO2.
11	LO1	Local Oscillator Input 1. Drive LOSEL low to select LO1.
15	LO2	Local Oscillator Input 2. Drive LOSEL high to select LO2.
18, 19	IF-, IF+	Differential IF Input/Outputs
EP	GND	Exposed Ground Paddle. Solder the exposed paddle to the ground plane using multiple vias.

Detailed Description

The MAX2041 can operate either as a downconverter or an upconverter mixer that provides 7.2dB of conversion loss with a typical 7.4dB noise figure. IIP3 is +33.5dBm for both upconversion and downconversion operation. The integrated baluns and matching circuitry allow for 50Ω single-ended interfaces to the RF port and two LO ports. The RF port can be used as an input for downconversion or an output for upconversion. A single-pole, double-throw (SPDT) switch provides 50ns switching time between the two LO inputs with 43dB of LO-to-LO isolation. Furthermore, the integrated LO buffer provides a high drive level to the mixer core, reducing the LO drive required at the MAX2041's inputs to a range of -3dBm to +3dBm. The IF port incorporates a differential output for downconversion, which is ideal for providing enhanced IIP2 performance. For upconversion, the IF port is a differential input.

Specifications are guaranteed over broad frequency ranges to allow for use in UMTS, cdma2000, 2G/2.5G/3G DCS 1800, PCS 1900, and WiMAX base stations. The MAX2041 is specified to operate over an RF frequency range of 1700MHz to 3000MHz, an LO frequency range of 1900MHz to 3000MHz, and an IF frequency range of DC to 350MHz. Operation beyond these ranges is possible; see the *Typical Operating Characteristics* for additional details.

This device can operate equally well in low-side LO injection applications as long as the LO frequency range is between 1900MHz and 3000MHz. If an LO frequency range below 1900MHz is desired, refer to the MAX2039.

RF Port and Balun

For using the MAX2041 as a downconverter, the RF input is internally matched to 50Ω, requiring no external matching components. A DC-blocking capacitor is required since the input is internally DC shorted to ground through the on-chip balun. The RF return loss is typically better than 17dB over a 1400MHz to 3000MHz frequency range. For upconverter operation, the RF port is a single-ended output similarly matched to 50Ω.

LO Inputs, Buffer, and Balun

The MAX2041 can be used for either high-side or low-side injection applications with a 1900MHz to 3000MHz LO frequency range. For a device with a 1500MHz to 2000MHz LO frequency range, refer to the MAX2039 data sheet. As an added feature, the MAX2041 includes an internal LO SPDT switch that can be used for frequency-hopping applications. The switch selects one of the two single-ended LO ports, allowing the external oscillator to settle on a particular frequency before it is switched in. LO switching time is typically less than 50ns, which is more than adequate for virtually all GSM applications. If frequency hopping is not employed, set the switch to either of the LO inputs. The switch is controlled by a digital input (LOSEL): logic-high selects LO2, logic-low selects LO1. To avoid damage to the part, voltage **MUST**

High-Linearity, 1700MHz to 3000MHz Upconversion/Downconversion Mixer with LO Buffer/Switch

be applied to V_{CC} before digital logic is applied to LOSEL (see the *Absolute Maximum Ratings*). LO1 and LO2 inputs are internally matched to 50Ω , requiring only a 22pF DC-blocking capacitor.

A two-stage internal LO buffer allows a wide-input power range for the LO drive. The on-chip low-loss balun, along with an LO buffer, drives the double-balanced mixer. All interfacing and matching components from the LO inputs to the IF outputs are integrated on chip.

High-Linearity Mixer

The core of the MAX2041 is a double-balanced, high-performance passive mixer. Exceptional linearity is provided by the large LO swing from the on-chip LO buffer.

Differential IF

The MAX2041 mixer has an IF frequency range of DC to 350MHz. Note that these differential ports are ideal for providing enhanced IIP2 performance. Single-ended IF applications require a 1:1 balun to transform the 50Ω differential IF impedance to a 50Ω single-ended system. After the balun, the IF return loss is better than 15dB. The differential IF is used as an input port for upconverter operation. The user can use a differential IF amplifier following the mixer but a DC block is required on both IF pins. In this configuration, the IF+ and IF- pins need to be returned to ground through a high resistance (about $1k\Omega$). This ground return can also be accomplished by grounding the RF TAP (pin 3) and AC-coupling the IF+ and IF- ports (pins 19 and 18).

Applications Information

Input and Output Matching

The RF and LO inputs are internally matched to 50Ω . No matching components are required. Return loss at the RF port is typically better than 17dB over a 1400MHz to 3000MHz frequency range, and return loss at the LO ports is typically better than 16dB over a 1900MHz to 3000MHz frequency range. RF and LO inputs require only DC-blocking capacitors for interfacing.

The IF output impedance is 50Ω (differential). For evaluation, an external low-loss 1:1 (impedance ratio) balun transforms this impedance to a 50Ω single-ended output (see the *Typical Application Circuit*).

Bias Resistor

Bias current for the LO buffer is optimized by fine tuning resistor R1. If reduced current is required at the expense of performance, contact the factory for details. If the $\pm 1\%$ bias resistor values are not readily available, substitute standard $\pm 5\%$ values.

Layout Considerations

A properly designed PC board is an essential part of any RF/microwave circuit. Keep RF signal lines as short as possible to reduce losses, radiation, and inductance. For the best performance, route the ground pin traces directly to the exposed pad under the package. The PC board exposed pad **MUST** be connected to the ground plane of the PC board. It is suggested that multiple vias be used to connect this pad to the lower-level ground planes. This method provides a good RF/thermal conduction path for the device. Solder the exposed pad on the bottom of the device package to the PC board. The MAX2041 Evaluation Kit can be used as a reference for board layout. Gerber files are available upon request at www.maxim-ic.com.

Power-Supply Bypassing

Proper voltage-supply bypassing is essential for high-frequency circuit stability. Bypass each V_{CC} pin and TAP with the capacitors shown in the *Typical Application Circuit*; see Table 1. Place the TAP bypass capacitor to ground within 100 mils of the TAP pin.

Table 1. Component List Referring to the Typical Application Circuit

COMPONENT	VALUE	DESCRIPTION
C1	4pF	Microwave capacitor (0603)
C4	10pF	Microwave capacitor (0603)
C2, C6, C7, C8, C10, C12	22pF	Microwave capacitors (0603)
C3, C5, C9, C11	0.01 μ F	Microwave capacitors (0603)
R1	549 Ω	$\pm 1\%$ resistor (0603)
T1	1:1 Balun	IF balun with DC grounded ports M/A-COM MABAES0029
U1	MAX2041	Maxim IC

Exposed Pad RF/Thermal Considerations

The EP of the MAX2041's 20-pin thin QFN-EP package provides a low thermal-resistance path to the die. It is important that the PC board on which the MAX2041 is mounted be designed to conduct heat from the EP. In addition, provide the EP with a low-inductance path to electrical ground. The EP **MUST** be soldered to a ground plane on the PC board, either directly or through an array of plated via holes.

JEDEC	WHHR			WHHC			WHHD-1			WHHD-2			----		

NOTES:

- DIMENSIONING & TOLERANCING CONFORM TO ASME Y14.5M-1994.
- ALL DIMENSIONS ARE IN MILLIMETERS. ANGLES ARE IN DEGREES.
- N IS THE TOTAL NUMBER OF TERMINALS.
- THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO JEDEC 95-1 SPP-012. DETAILS OF TERMINAL #1 IDENTIFIER ARE OPTIONAL, BUT MUST BE LOCATED WITHIN THE ZONE INDICATED. THE TERMINAL #1 IDENTIFIER MAY BE EITHER A MOLD OR MARKED FEATURE.
- DIMENSION b APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.25 mm AND 0.30 mm FROM TERMINAL TIP.
- ND AND NE REFER TO THE NUMBER OF TERMINALS ON EACH D AND E SIDE RESPECTIVELY.
- DEPOPULATION IS POSSIBLE IN A SYMMETRICAL FASHION.
- COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.
- DRAWING CONFORMS TO JEDEC MO220, EXCEPT EXPOSED PAD DIMENSION FOR T2855-3 AND T2855-6.
- WARPAGE SHALL NOT EXCEED 0.10 mm.
- MARKING IS FOR PACKAGE ORIENTATION REFERENCE ONLY.
- NUMBER OF LEADS SHOWN ARE FOR REFERENCE ONLY.
- LEAD CENTERLINES TO BE AT TRUE POSITION AS DEFINED BY BASIC DIMENSION "e", -0.05.

-DRAWING NOT TO SCALE-

EXPOSED PAD VARIATIONS
