

Dual RF/IF PLL Frequency Synthesizers

ADF4210/ADF4211/ADF4212/ADF4213

FEATURES

ADF4210: 550 MHz/1.2 GHz
ADF4211: 550 MHz/2.0 GHz
ADF4212: 1.0 GHz/2.7 GHz
ADF4213: 1.0 GHz/3 GHz
2.7 V to 5.5 V Power Supply
Separate Charge Pump Supply (V_P) Allows Extended Tuning Voltage in 3 V Systems
Programmable Dual Modulus Prescaler
RF and IF: 8/9, 16/17, 32/33, 64/65
Programmable Charge Pump Currents
3-Wire Serial Interface
Analog and Digital Lock Detect
Fastlock Mode
Power-Down Mode

APPLICATIONS

Base Stations for Wireless Radio (GSM, PCS, DCS, CDMA, WCDMA)
Wireless Handsets (GSM, PCS, DCS, CDMA, WCDMA)
Wireless LANS
Communications Test Equipment
CATV Equipment

GENERAL DESCRIPTION

The ADF4210/ADF4211/ADF4212/ADF4213 is a dual frequency synthesizer that can be used to implement local oscillators (LO) in the upconversion and downconversion sections of wireless receivers and transmitters. They can provide the LO for both the RF and IF sections. They consist of a low-noise digital PFD (Phase Frequency Detector), a precision charge pump, a programmable reference divider, programmable A and B Counters and a dual-modulus prescaler ($P/P + 1$). The A (6-bit) and B (12-bit) counters, in conjunction with the dual modulus prescaler ($P/P + 1$), implement an N divider ($N = BP + A$). In addition, the 14-bit reference counter (R Counter), allows selectable REFIN frequencies at the PFD input. A complete PLL (Phase-Locked Loop) can be implemented if the synthesizer is used with an external loop filter and VCO (Voltage Controlled Oscillators).

Control of all the on-chip registers is via a simple 3-wire interface. The devices operate with a power supply ranging from 2.7 V to 5 V and can be powered down when not in use.

NOTES

¹Operating temperature range is as follows: B Version: -40°C to +85°C.

²The B Chip specifications are given as typical values.

³This is the maximum operating frequency of the CMOS counters. The prescaler value should be chosen to ensure that the IF/RF input is divided down to a frequency that is less than this value.

⁴V_{DD1} = V_{DD2} = 3 V; For V_{DD1} = V_{DD2} = 5 V, use CMOS-compatible levels, T_A = 25°C.

⁵Guaranteed by design. Sample tested to ensure compliance.

⁶V_{DD} = 3 V; P = 16; RF_{IN} = 900 MHz; IF_{IN} = 540 MHz; T_A = 25°C.

⁷The synthesizer phase noise floor is estimated by measuring the in-band phase noise at the output of the VCO and subtracting 20 logN (where N is the N divider value). See TPC 16.

⁸The phase noise is measured with the EVAL-ADF4210/ADF4212/ADF4213EB Evaluation Board and the HP8562E Spectrum Analyzer. The spectrum analyzer provides the REFIN for the synthesizer (f_{REFOUT} = 10 MHz @ 0 dBm).

⁹f_{REFIN} = 10 MHz; f_{PFD} = 200 kHz; Offset frequency = 1 kHz; f_{IF} = 540 MHz; N = 2700; Loop B/W = 20 kHz.

¹⁰f_{REFIN} = 10 MHz; f_{PFD} = 200 kHz; Offset frequency = 1 kHz; f_{RF} = 900 MHz; N = 4500; Loop B/W = 20 kHz.

¹¹Same conditions as listed in Note 10.

¹²f_{REFIN} = 10 MHz; f_{PFD} = 200 kHz; Offset frequency = 1 kHz; f_{RF} = 1750 MHz; N = 8750; Loop B/W = 20 kHz.

¹³f_{REFIN} = 10 MHz; f_{PFD} = 10 kHz; Offset frequency = 200 Hz; f_{RF} = 1750 MHz; N = 175000; Loop B/W = 1 kHz.

¹⁴f_{REFIN} = 10 MHz; f_{PFD} = 1 MHz; Offset frequency = 1 kHz; f_{RF} = 1960 MHz; N = 9800; Loop B/W = 20 kHz.

Specifications subject to change without notice.

ADF4210/ADF4211/ADF4212/ADF4213

TIMING CHARACTERISTICS ($V_{DD1} = V_{DD2} = 3\text{ V} \pm 10\%$, $5\text{ V} \pm 10\%$; $V_{DD1}, V_{DD2} \leq V_{P1}, V_{P2} \leq 6\text{ V} \pm 10\%$; $AGND_{RF} = DGND_{RF} = AGND_{IF} = DGND_{IF} = 0\text{ V}$; $T_A = T_{MIN}$ to T_{MAX} unless otherwise noted.)

Parameter	Limit at T_{MIN} to T_{MAX} (B Version)	Unit	Test Conditions/Comments

NOTES

¹Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

²This device is a high-performance RF integrated circuit with an ESD rating of < 2 kV and it is ESD sensitive. Proper precautions should be taken for handling and assembly.

³GND = AGND = DGND = 0 V.

TRANSISTOR COUNT

11749 (CMOS) and 522 (Bipolar).

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADF4210/ADF4211/ADF4212/ADF4213 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high-energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

ADF4210/ADF4211/ADF4212/ADF4213

PIN FUNCTION DESCRIPTIONS

Pin Number TSSOP	Mnemonic	Function
1	V _{DD1}	Power Supply for the RF Section. Decoupling capacitors to the ground plane should be placed as close as possible to this pin. V _{DD1} should have a value of between 2.7 V and 5.5 V. V _{DD1} must have the same potential as V _{DD2} .
2	V _{P1}	Power Supply for the RF Charge Pump. This should be greater than or equal to V _{DD1} . In systems where V _{DD1} is 3 V, it can be set to 6 V and used to drive a VCO with a tuning range up to 6 V.
3	CP _{RF}	Output from the RF Charge Pump. This is normally connected to a loop filter which drives the input to an external VCO.
4	DGND _{RF}	Ground Pin for the RF Digital Circuitry.
5	RF _{IN}	Input to the RF Prescaler. This low level input signal is ac-coupled from the RF VCO.
6	AGND _{RF}	Ground Pin for the RF Analog Circuitry.
7	FL _O	RF/IF Fastlock Mode.
8	REF _{IN}	Reference Input. This is a CMOS input with a nominal threshold of V _{DD} /2 and an equivalent input resistance of 100 kΩ. This input can be driven from a TTL or CMOS crystal oscillator.
9	DGND _{IF}	Digital Ground for the IF Digital, Interface and Control Circuitry.
10	MUXOUT	This multiplexer output allows either the IF/RF Lock Detect, the scaled RF, scaled IF or the scaled Reference Frequency to be accessed externally.
11	CLK	Serial Clock Input. This serial clock is used to clock in the serial data to the registers. The data is latched into the 24-bit shift register on the CLK rising edge. This input is a high impedance CMOS input.
12	DATA	Serial Data Input. The serial data is loaded MSB first with the two LSBs being the control bits. This input is a high impedance CMOS input.
13	LE	Load Enable, CMOS Input. When LE goes high, the data stored in the shift registers is loaded into one of the four latches, the latch being selected using the control bits.
14	R _{SET}	Connecting a resistor between this pin and ground sets the maximum RF and IF charge pump output current. The nominal voltage potential at the R _{SET} pin is 0.66 V. The relationship between I _{CP} and R _{SET} is $I_{CP\ MAX} = \frac{13.5}{R_{SET}}$ So, with R _{SET} = 2.7 kΩ, I _{CP} MAX = 5 mA for both the RF and IF Charge Pumps.
15	AGND _{IF}	Ground Pin for the IF Analog Circuitry.
16	IF _{IN}	Input to the RF Prescaler. This low-level input signal is ac-coupled from the IF VCO.
17	DGND _{IF}	Ground Pin for the IF Digital, Interface, and Control Circuitry.
18	CP _{IF}	Output from the IF Charge Pump. This is normally connected to a loop filter which drives the input to an external VCO.
19	V _{P2}	Power Supply for the IF Charge Pump. This should be greater than or equal to V _{DD2} . In systems where V _{DD2} is 3 V, it can be set to 6 V and used to drive a VCO with a tuning range up to 6 V.
20	V _{DD2}	Power Supply for the IF, Digital and Interface Section. Decoupling capacitors to the ground plane should be placed as close as possible to this pin. V _{DD2} should have a value of between 2.7 V and 5.5 V. V _{DD2} must have the same potential as V _{DD1} .

PHASE FREQUENCY DETECTOR (PFD) AND CHARGE PUMP

The PFD takes inputs from the R counter and N counter and produces an output proportional to the phase and frequency difference between them. Figure 5 is a simplified schematic. The PFD includes a fixed-delay element that sets the width of the antibacklash pulse. This is typically 3 ns. This pulse ensures that there is no deadzone in the PFD transfer function and gives a consistent reference spur level.

Figure 5. RF/IF PFD Simplified Schematic and Timing (In Lock)

MUXOUT AND LOCK DETECT

The output multiplexer on the ADF421x family allows the user to access various internal points on the chip. The state of MUXOUT is controlled by P3, P4, P11, and P12. See Tables III and V. Figure 6 shows the MUXOUT section in block diagram form.

Figure 6. MUXOUT Circuit

Lock Detect

MUXOUT can be programmed for two types of lock detect: Digital Lock Detect and Analog Lock Detect. Digital Lock Detect is active high. It is set high when the phase error on three consecutive Phase Detector cycles is less than 15 ns. It will stay set high until a phase error of greater than 25 ns is detected on any subsequent PD cycle. The N-channel open-drain analog lock detect should be operated with an external pull-up resistor of 10 kΩ nominal. When lock has been detected, it is high with narrow low-going pulses.

RF/IF INPUT SHIFT REGISTER

The ADF421x family digital section includes a 24-bit input shift register, a 14-bit IF R counter and a 18-bit IF N counter, comprising a 6-bit IF A counter and a 12-bit IF B counter. Also present is a 14-bit RF R counter and an 18-bit RF N counter, comprising a 6-bit RF A counter and a 12-bit RF B counter. Data is clocked into the 24-bit shift register on each rising edge of CLK. The data is clocked in MSB first. Data is transferred from the shift register to one of four latches on the rising edge of LE. The destination latch is determined by the state of the two control bits (C2, C1) in the shift register. These are the two LSBs DB1, DB0 as shown in the timing diagram of Figure 1. The truth table for these bits is shown in Table VI. Table I shows a summary of how the latches are programmed.

Table I. C2, C1 Truth Table

ADF4210/ADF4211/ADF4212/ADF4213

PROGRAM MODES

Table III and Table V show how to set up the Program Modes in the ADF421x family. The following should be noted:

1. IF and RF Analog Lock Detect indicate when the PLL is in lock. When the loop is locked and either IF or RF Analog Lock Detect is selected, the MUXOUT pin will show a logic high with narrow low-going pulses. When the IF/RF Analog Lock Detect is chosen, the locked condition is indicated only when both IF and RF loops are locked.
2. The IF Counter Reset mode resets the R and AB counters in the IF section and also puts the IF charge pump into three-state. The RF Counter Reset mode resets the R and AB counters in the RF section and also puts the RF charge pump into three-state. The IF and RF Counter Reset mode does both of the above. Upon removal of the reset bits, the AB counter resumes counting in close alignment with the R counter (maximum error is one prescaler output cycle).
3. The Fastlock mode uses MUXOUT to switch a second loop filter damping resistor to ground during Fastlock operation. Activation of Fastlock occurs whenever RF CP Gain in the RF Reference counter is set to one.

IF Power-Down

It is possible to program the ADF421x family for either synchronous or asynchronous power-down on either the IF or RF side.

Synchronous IF Power-Down

Programming a “1” to P7 of the ADF421x family will initiate a power-down. If P2 of the ADF421x family has been set to “0” (normal operation), a synchronous power-down is conducted. The device will automatically put the charge pump into three-state and then complete the power-down.

Asynchronous IF Power-Down

If P2 of the ADF421x family has been set to “1” (three-state the IF charge pump), and P7 is subsequently set to “1,” an asynchronous power-down is conducted. The device will go into power-down on the rising edge of LE, which latches the “1” to the IF power-down bit (P7).

Synchronous RF Power-Down

Programming a “1” to P16 of the ADF421x family will initiate a power-down. If P10 of the ADF421x family has been set to “0” (normal operation), a synchronous power-down is conducted. The device will automatically put the charge pump into three-state and then complete the power-down.

Asynchronous RF Power-Down

If P10 of the ADF421x family has been set to “1” (three-state the RF charge pump), and P16 is subsequently set to “1,” an asynchronous power-down is conducted. The device will go into power down on the rising edge of LE, which latches the “1” to the RF power-down bit (P16).

Activation of either synchronous or asynchronous power-down forces the IF/RF loop’s R and AB dividers to their load state conditions and the IF/RF input section is debiased to a high-impedance state.

The REF_{IN} oscillator circuit is only disabled if both the IF and RF power-downs are set.

The input register and latches remain active and are capable of loading and latching data during all the power-down modes.

The IF/RF section of the devices will return to normal powered up operation immediately upon LE latching a “0” to the appropriate power-down bit.

IF SECTION

PROGRAMMABLE IF REFERENCE (R) COUNTER

If control bits C2, C1 are 0, 0, the data is transferred from the input shift register to the 14-bit IFR counter. Table III shows the input shift register data format for the IFR counter and the divide ratios possible.

IF Phase Detector Polarity

P1 sets the IF Phase Detector Polarity. When the IF VCO characteristics are positive this should be set to “1.” When they are negative it should be set to “0.” See Table III.

IF Charge Pump Three-State

P2 puts the IF charge pump into three-state mode when programmed to a “1.” It should be set to “0” for normal operation. See Table III.

IF PROGRAM MODES

Table III and Table V show how to set up the Program Modes in the ADF421x family.

IF Charge Pump Currents

IFCP2, IFCP1, IFCP0 program current setting for the IF charge pump. See Table III.

PROGRAMMABLE IF AB COUNTER

If control bits C2, C1 are 0, 1, the data in the input register is used to program the IF AB counter. The N counter consists of a 6-bit swallow counter (A counter) and 12-bit programmable counter (B counter). Table IV shows the input register data format for programming the IF AB counter and the possible divide ratios.

IF Prescaler Value

P5 and P6 in the IF A, B Counter Latch sets the IF prescaler value. See Table IV.

IF Power-Down

Table III and Table V show the power-down bits in the ADF421x family.

IF Fastlock

The IF CP Gain bit (P8) of the IF N register in the ADF421x family is the Fastlock Enable Bit. Only when this is “1” is IF Fastlock enabled. When Fastlock is enabled, the IF CP current is set to its maximum value. Since the IF CP Gain bit is contained in the IF N Counter, only one write is needed to both program a new output frequency and also initiate Fastlock. To come out of Fastlock, the IF CP Gain bit on the IF N register must be set to “0.” See Table IV.

RF SECTION

PROGRAMMABLE RF REFERENCE (R) COUNTER

If control bits C2, C1 are 1, 0, the data is transferred from the input shift register to the 14-bit RFR counter. Table V shows the input shift register data format for the RFR counter and the possible divide ratios.

RF Phase Detector Polarity

P9 sets the RF Phase Detector Polarity. When the RF VCO characteristics are positive this should be set to “1.” When they are negative it should be set to “0.” See Table V.

RF Charge Pump Three-State

P10 puts the RF charge pump into three-state mode when programmed to a “1.” It should be set to “0” for normal operation. See Table V.

RF PROGRAM MODES

ADF4210/ADF4211/ADF4212/ADF4213

Figure 8. Wideband PLL Circuit

in wide-band applications both of these parameters have a much greater variation. In Figure 8, for example, we have -25% and $+30\%$ variation in the RF output from the nominal 1.8 GHz. The sensitivity of the VCO can vary from 130 MHz/V at 1900 MHz to 30 MHz/V at 2400 MHz. Variations in these parameters will change the loop bandwidth. This in turn can affect stability and lock time. By changing the programmable I_{CP} , it is possible to obtain compensation for these varying loop conditions and ensure that the loop is always operating close to optimal conditions.

INTERFACING

The ADF4210/ADF4211/ADF4212/ADF4213 family has a simple SPI-compatible serial interface for writing to the device. SCLK, SDATA, and LE control the data transfer. When LE (Latch Enable) goes high, the 22 bits that have been clocked into the input register on each rising edge of SCLK will be transferred to the appropriate latch. See Figure 1 for the Timing Diagram and Table I for the Latch Truth Table.

The maximum allowable serial clock rate is 20 MHz. This means that the maximum update rate possible for the device is 909 kHz, or one update every 1.1 ms. This is certainly more than adequate for systems that will have typical lock times in hundreds of microseconds.

ADuC812 to ADF421x Family Interface

Figure 9 shows the interface between the ADF421x family and the ADuC812 microconverter. Since the ADuC812 is based on an 8051 core, this interface can be used with any 8051-based microcontroller. The microconverter is set up for SPI Master Mode with $CPHA = 0$. To initiate the operation, the I/O port driving LE is brought low. Each latch of the ADF421x family needs a 24-bit word. This is accomplished by writing three 8-bit bytes from the microconverter to the device. When the third byte has been written, the LE input should be brought high to complete the transfer.

On first applying power to the ADF421x family, it needs four writes (one each to the R counter latch and the AB counter latch for both RF1 and RF2 sides) for the output to become active.

When operating in the mode described, the maximum SCLOCK rate of the ADuC812 is 4 MHz. This means that the maximum rate at which the output frequency can be changed will be about 180 kHz.

Figure 9. ADuC812 to ADF421x Family Interface

ADSP-21xx to ADF421x Family Interface

Figure 10 shows the interface between the ADF421x family and the ADSP-21xx Digital Signal Processor. As previously discussed, the ADF421x family needs a 24-bit serial word for each latch write. The easiest way to accomplish this, using the ADSP-21xx family, is to use the Autobuffered Transmit Mode of operation with Alternate Framing. This provides a means for transmitting an entire block of serial data before an interrupt is generated. Set up the word length for eight bits and use three memory locations for each 24-bit word. To program each 24-bit latch, store the three 8-bit bytes, enable the Autobuffered mode, and write to the transmit register of the DSP. This last operation initiates the autobuffer transfer.

Figure 10. ADSP-21xx to ADF421x Family Interface

PCB Guidelines for Chip Scale Package

The lands on the chip scale package (CP-20), are rectangular. The printed circuit board pad for these should be 0.1 mm longer than the package land length and 0.05 mm wider than the package land width. The land should be centered on the pad. This will ensure that the solder joint size is maximized.

The bottom of the chip scale package has a central thermal pad. The thermal pad on the printed circuit board should be at least as large as this exposed pad. On the printed circuit board, there should be clearance of at least 0.25 mm between the thermal pad and inner edges of the pad pattern. This will ensure that shorting is avoided.

Thermal vias may be used on the printed circuit board thermal pad to improve thermal performance of the package. If vias are used, they should be incorporated in the thermal pad at 1.2 mm grid pitch. The via diameter should be between 0.3 mm and 0.33 mm and the via barrel should be plated with 1 oz. copper to plug the via. The user should connect the printed circuit board pad to AGND.
