

Features

- High-speed, low-power, first-in, first-out (FIFO) memories
 - 256 × 9 (CY7C4201V)
 - 512 × 9 (CY7C4211V)
- High-speed 66-MHz operation (15-ns read/write cycle time)
- Low power ($I_{CC} = 20$ mA)
- 3.3 V operation for low power consumption and easy integration into low-voltage systems
- 5V-tolerant inputs $V_{IH(max)} = 5$ V
- Fully asynchronous and simultaneous read and write operation
- Empty, full, and programmable almost empty and almost full status flags
- TTL compatible
- Output Enable (\overline{OE}) pin
- Independent read and write enable pins
- Center power and ground pins for reduced noise
- Width expansion capability
- Space saving 32-pin 7 mm × 7 mm TQFP
- 32-pin PLCC available in Pb-free Packages

Functional Description

The CY7C42X1V are high-speed, low-power, FIFO memories with clocked read and write interfaces. All are nine bits wide. Programmable features include Almost Full/Almost Empty flags. These FIFOs provide solutions for a wide variety of data buffering needs, including high-speed data acquisition, multiprocessor interfaces, and communications buffering.

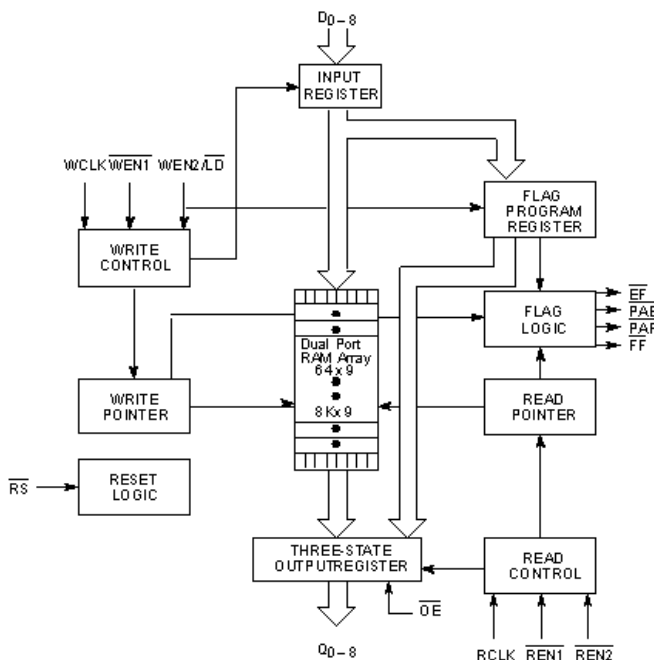

These FIFOs have 9-bit input and output ports that are controlled by separate clock and enable signals. The input port is controlled by a Free-Running Clock (WCLK) and two Write Enable pins (WEN1, WEN2/LD).

When $\overline{WEN1}$ is LOW and WEN2/ \overline{LD} is HIGH, data is written into the FIFO on the rising edge of the WCLK signal. While $\overline{WEN1}$, WEN2/ \overline{LD} is held active, data is continually written into the FIFO on each WCLK cycle. The output port is controlled in a similar manner by a Free-Running Read Clock (RCLK) and two Read Enable Pins (REN1, REN2). In addition, the CY7C42X1V has an Output Enable Pin (OE). The Read (RCLK) and Write (WCLK) clocks may be tied together for single clock operation or the two clocks may be run independently for asynchronous read/write applications. Clock frequencies up to 66 MHz are achievable.

Depth expansion is possible using one enable input for system control, while the other enable is controlled by expansion logic to direct the flow of data.

Pin Configuration

Figure 1. 32-pin TQFP pinout

Pin Definitions

Signal Name		I/O	Description
D ₀₋₈	Data Inputs	I	Data Inputs for 9-bit bus.
Q ₀₋₈	Data Outputs	O	Data Outputs for 9-bit bus.
WEN1	Write Enable 1	I	The only write enable when device is configured to have programmable flags. Data is written on a LOW-to-HIGH transition of WCLK when WEN1 is asserted and FF is HIGH. If the FIFO is configured to have two write enables, data is written on a LOW-to-HIGH transition of WCLK when WEN1 is LOW and WEN2/LD and FF are HIGH.
WEN2/LD Dual Mode Pin	Write Enable 2	I	If HIGH at reset, this pin operates as a second write enable. If LOW at reset, this pin operates as a control to write or read the programmable flag offsets. WEN1 must be LOW and WEN2 must be HIGH to write data into the FIFO. Data will not be written into the FIFO if the FF is LOW. If the FIFO is configured to have programmable flags, WEN2/LD is held LOW to write or read the programmable flag offsets.
	Load	I	
REN1, REN2	Read Enable Inputs	I	Enables the device for Read operation.
WCLK	Write Clock	I	The rising edge clocks data into the FIFO when WEN1 is LOW and WEN2/LD is HIGH and the FIFO is not Full. When LD is asserted, WCLK writes data into the programmable flag-offset register.
RCLK	Read Clock	I	The rising edge clocks data out of the FIFO when REN1 and REN2 are LOW and the FIFO is not Empty. When WEN2/LD is LOW, RCLK reads data out of the programmable flag offset register.
EF	Empty Flag	O	When EF is LOW, the FIFO is empty. EF is synchronized to RCLK.
FF	Full Flag	O	When FF is LOW, the FIFO is full. FF is synchronized to WCLK.
PAE	Programmable Almost Empty	O	When PAE is LOW, the FIFO is almost empty based on the almost empty offset value programmed into the FIFO.
PAF	Programmable Almost Full	O	When PAF is LOW, the FIFO is almost full based on the almost full offset value programmed into the FIFO.
RS	Reset	I	Resets device to empty condition. A reset is required before an initial read or write operation after power-up.
OE	Output Enable	I	When OE is LOW, the FIFO's data outputs drive the bus to which they are connected. If OE is HIGH, the FIFO's outputs are in High Z (high-impedance) state.

Selection Guide

Description		CY7C42X1V-15	Unit

Minimum Cycle Time		15	ns
Minimum Data or Enable Set-up		4	ns
Minimum Data or Enable Hold		1	ns
Maximum Flag Delay		10	ns
Active Power Supply Current	Commercial	20	mA

Architecture

The CY7C42X1V consists of an array of 64 to 8K words of nine bits each (implemented by a dual-port array of SRAM cells), a read pointer, a write pointer, control signals (\overline{RCLK} , \overline{WCLK} , $\overline{REN1}$, $\overline{REN2}$, $\overline{WEN1}$, $\overline{WEN2}$, \overline{RS}), and flags (\overline{EF} , \overline{PAE} , \overline{PAF} , \overline{FF}).

Functional Overview

The CY7C42X1V provides four status pins: Empty, Full, Almost Empty, Almost Full. The Almost Empty/Almost Full flags are programmable to single word granularity. The programmable flags default to Empty-7 and Full-7.

The flags are synchronous, that is, they change state relative to either the Read Clock (\overline{RCLK}) or the Write Clock (\overline{WCLK}). When entering or exiting the Empty and Almost Empty states, the flags are updated exclusively by the \overline{RCLK} . The flags denoting Almost Full and Full states are updated exclusively by \overline{WCLK} . The synchronous flag architecture guarantees that the flags maintain their status for at least one cycle.

All configurations are fabricated using an advanced 0.65μ P-Well CMOS technology. Input ESD protection is greater than 2001 V, and latch-up is prevented by the use of guard rings.

Resetting the FIFO

Upon power-up, the FIFO must be reset with a Reset (\overline{RS}) cycle. This causes the FIFO to enter the Empty condition signified by \overline{EF} being LOW. All data outputs (Q_{0-8}) go LOW t_{RSF} after the rising edge of \overline{RS} . In order for the FIFO to reset to its default state, a falling edge must occur on \overline{RS} and the user must not read or write while \overline{RS} is LOW. All flags are guaranteed to be valid t_{RSF} after \overline{RS} is taken LOW.

FIFO Operation

When the $\overline{WEN1}$ signal is active LOW and $\overline{WEN2}$ is active HIGH, data present on the D_{0-8} pins is written into the FIFO on each

rising edge of the \overline{WCLK} signal. Similarly, when the $\overline{REN1}$ and $\overline{REN2}$ signals are active LOW, data in the FIFO memory will be presented on the Q_{0-8} outputs. New data will be presented on each rising edge of \overline{RCLK} while $\overline{REN1}$ and $\overline{REN2}$ are active. $\overline{REN1}$ and $\overline{REN2}$ must set up t_{ENS} before \overline{RCLK} for it to be a valid read function. $\overline{WEN1}$ and $\overline{WEN2}$ must occur t_{ENS} before \overline{WCLK} for it to be a valid write function.

An Output Enable (\overline{OE}) pin is provided to three-state the Q_{0-8} outputs when \overline{OE} is asserted. When \overline{OE} is enabled (LOW), data in the output register will be available to the Q_{0-8} outputs after t_{OE} .

The FIFO contains overflow circuitry to disallow additional writes when the FIFO is full, and underflow circuitry to disallow additional reads when the FIFO is empty. An empty FIFO maintains the data of the last valid read on its Q_{0-8} outputs even after additional reads occur.

Write Enable 1 ($\overline{WEN1}$). If the FIFO is configured for programmable flags, Write Enable 1 ($\overline{WEN1}$) is the only write enable control pin. In this configuration, when Write Enable 1 ($\overline{WEN1}$) is LOW, data can be loaded into the input register and RAM array on the LOW-to-HIGH transition of every write clock (\overline{WCLK}). Data is stored in the RAM array sequentially and independently of any on-going read operation.

Write Enable 2/Load ($\overline{WEN2/LD}$). This is a dual-purpose pin. The FIFO is configured at Reset to have programmable flags or to have two write enables, which allows for depth expansion. If Write Enable 2/Load ($\overline{WEN2/LD}$) is set active HIGH at Reset (\overline{RS} =LOW), this pin operates as a second write enable pin.

If the FIFO is configured to have two write enables, when Write Enable ($\overline{WEN1}$) is LOW and Write Enable 2/Load ($\overline{WEN2/LD}$) is HIGH, data can be loaded into the input register and RAM array on the LOW-to-HIGH transition of every write clock (\overline{WCLK} .) Data is stored in the RAM array sequentially and independently of any on-going read operation.

Programming

When $\overline{\text{WEN2/LD}}$ is held LOW during Reset, this pin is the load ($\overline{\text{LD}}$) enable for flag offset programming. In this configuration, $\overline{\text{WEN2/LD}}$ can be used to access the four 8-bit offset registers contained in the CY7C42X1V for writing or reading data to these registers.

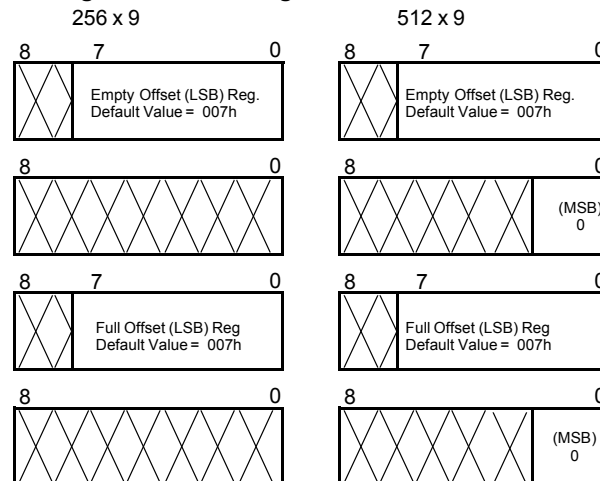

When the device is configured for programmable flags and both $\overline{\text{WEN2/LD}}$ and $\overline{\text{WEN1}}$ are LOW, the first LOW-to-HIGH transition of WCLK writes data from the data inputs to the empty offset Least Significant Bit (LSB) register. The second, third, and fourth LOW-to-HIGH transitions of WCLK store data in the empty offset Most Significant Bit (MSB) register, full offset LSB register, and full offset MSB register, respectively, when $\overline{\text{WEN2/LD}}$ and $\overline{\text{WEN1}}$ are LOW. The fifth LOW-to-HIGH transition of WCLK while

$\overline{\text{WEN2/LD}}$ and $\overline{\text{WEN1}}$ are LOW writes data to the empty LSB register again. Figure 2 shows the register sizes and default values for the various device types.

It is not necessary to write to all the offset registers at one time. A subset of the offset registers can be written; then by bringing the $\overline{\text{WEN2/LD}}$ input HIGH, the FIFO is returned to normal read and write operation. The next time $\overline{\text{WEN2/LD}}$ is brought LOW, a write operation stores data in the next offset register in sequence.

The contents of the offset registers can be read to the data outputs when $\overline{\text{WEN2/LD}}$ is LOW and both $\overline{\text{REN1}}$ and $\overline{\text{REN2}}$ are LOW. LOW-to-HIGH transitions of RCLK read register contents to the data outputs. Writes and reads should not be performed simultaneously on the offset registers.

Figure 2. Offset Register Location and Default Values

Programmable Flag ($\overline{\text{PAE}}$, $\overline{\text{PAF}}$) Operation

Whether the flag offset registers are programmed as described in Table 1 or the default values are used, the programmable Almost Empty Flag (PAE) and programmable Almost Full Flag (PAF) states are determined by their corresponding offset registers and the difference between the read and write pointers.

Table 1. Writing the Offset Registers

LD	WEN	WCLK ^[1]	Selection
0	0		Empty Offset (LSB) Empty Offset (MSB) Full Offset (LSB) Full Offset (MSB)
0	1		No Operation
1	0		Write Into FIFO
1	1		No Operation

The number formed by the empty offset least significant bit register and empty offset most significant register is referred to as n and determines the operation of PAE. PAE is synchronized

to the LOW-to-HIGH transition of RCLK by one flip-flop and is LOW when the FIFO contains n or fewer unread words. PAE is set HIGH by the LOW-to-HIGH transition of RCLK when the FIFO contains $(n+1)$ or greater unread words.

The number formed by the full offset least significant bit register and full offset most significant bit register is referred to as m and determines the operation of PAF. PAF is synchronized to the LOW-to-HIGH transition of WCLK by one flip-flop and is set LOW when the number of unread words in the FIFO is greater than or equal to CY7C4201V $(256 - m)$ and CY7C4211V $(512 - m)$. PAF is set HIGH by the LOW-to-HIGH transition of WCLK when the number of available memory locations is greater than m .

Table 2. Status Flags

Number of Words in FIFO		$\overline{\text{FF}}$	$\overline{\text{PAF}}$	$\overline{\text{PAE}}$	$\overline{\text{EF}}$
CY7C4201V	CY7C4211V				
0	0	H	H	L	L
1 to $n^{[2]}$	1 to $n^{[2]}$	H	H	L	H
$(n+1)$ to 128	$(n+1)$ to 256	H	H	H	H
129 to $(256 - (m+1))$	257 to $(512 - (m+1))$	H	H	H	H
$(256 - m)^{[3]}$ to 255	$(512 - m)^{[3]}$ to 511	H	L	H	H
256	512	L	L	H	H

Notes

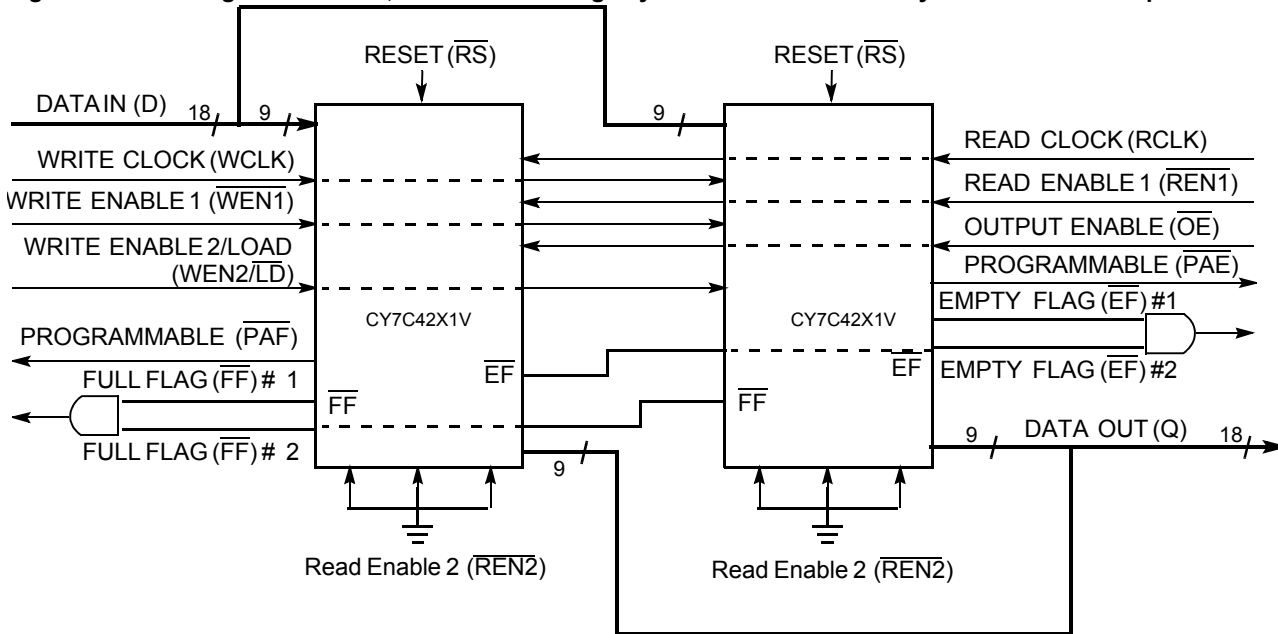

1. The same selection sequence applies to reading from the registers. $\overline{\text{REN1}}$ and $\overline{\text{REN2}}$ are enabled and a read is performed on the LOW-to-HIGH transition of RCLK.
2. n = Empty Offset ($n=7$ default value).
3. m = Full Offset ($m=7$ default value).

Width Expansion Configuration

Word width may be increased simply by connecting the corresponding input control signals of multiple devices. A composite flag should be created for each of the end-point status flags (\overline{EF} and \overline{FF}). The partial status flags (PAE and PAF) can be detected from any one device. Figure 3 demonstrates a 18-bit word width by using two CY7C42X1Vs. Any word width can be attained by adding additional CY7C42X1Vs.

When the CY7C42X1V is in a width expansion configuration, the Read Enable ($\overline{REN2}$) control input can be grounded (see Figure 3). In this configuration, the Write Enable 2/Load ($\overline{WEN2/LD}$) pin is set to LOW at Reset so that the pin operates as a control to load and read the programmable flag offsets.

Figure 3. Block Diagram of 256 x 9, 512 x 9 Low-Voltage Synchronous FIFO Memory Used in a Width-Expansion Configuration

Flag Operation

The CY7C42X1 devices provide four flag pins to indicate the condition of the FIFO contents. Empty, Full, PAE, and PAF are synchronous.

Full Flag

The Full Flag (\overline{FF}) will go LOW when device is full. Write operations are inhibited whenever \overline{FF} is LOW regardless of the state

of $\overline{WEN1}$ and $\overline{WEN2/LD}$. \overline{FF} is synchronized to WCLK, i.e., it is exclusively updated by each rising edge of WCLK.

Empty Flag

The Empty Flag (\overline{EF}) will go LOW when the device is empty. Read operations are inhibited whenever \overline{EF} is LOW, regardless of the state of $\overline{REN1}$ and $\overline{REN2}$. \overline{EF} is synchronized to RCLK, i.e., it is exclusively updated by each rising edge of RCLK.

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Storage Temperature -65 °C to +150 °C

Ambient Temperature with
Power Applied -55 °C to +125 °C

Supply Voltage to Ground Potential -0.5 V to +5.0 V

DC Voltage Applied to Outputs
in High-Z State -0.5 V to +5.0 V

DC Input Voltage -0.5 V to +5.0 V

Output Current into Outputs (LOW) 20 mA

Static Discharge Voltage
(per MIL-STD-883, Method 3015) > 2001 V

Latch up Current > 200 mA

Operating Range

Range	Ambient Temperature	V _{CC}
Commercial	0 °C to +70 °C	3.3 V ± 300 mV
Industrial	-40 °C to +85 °C	3.3 V ± 300 mV

Electrical Characteristics

Notes

9. Pulse widths less than minimum values are not allowed.
 10. Values guaranteed by design, not currently tested.

Switching Waveforms

Figure 5. Write Cycle Timing

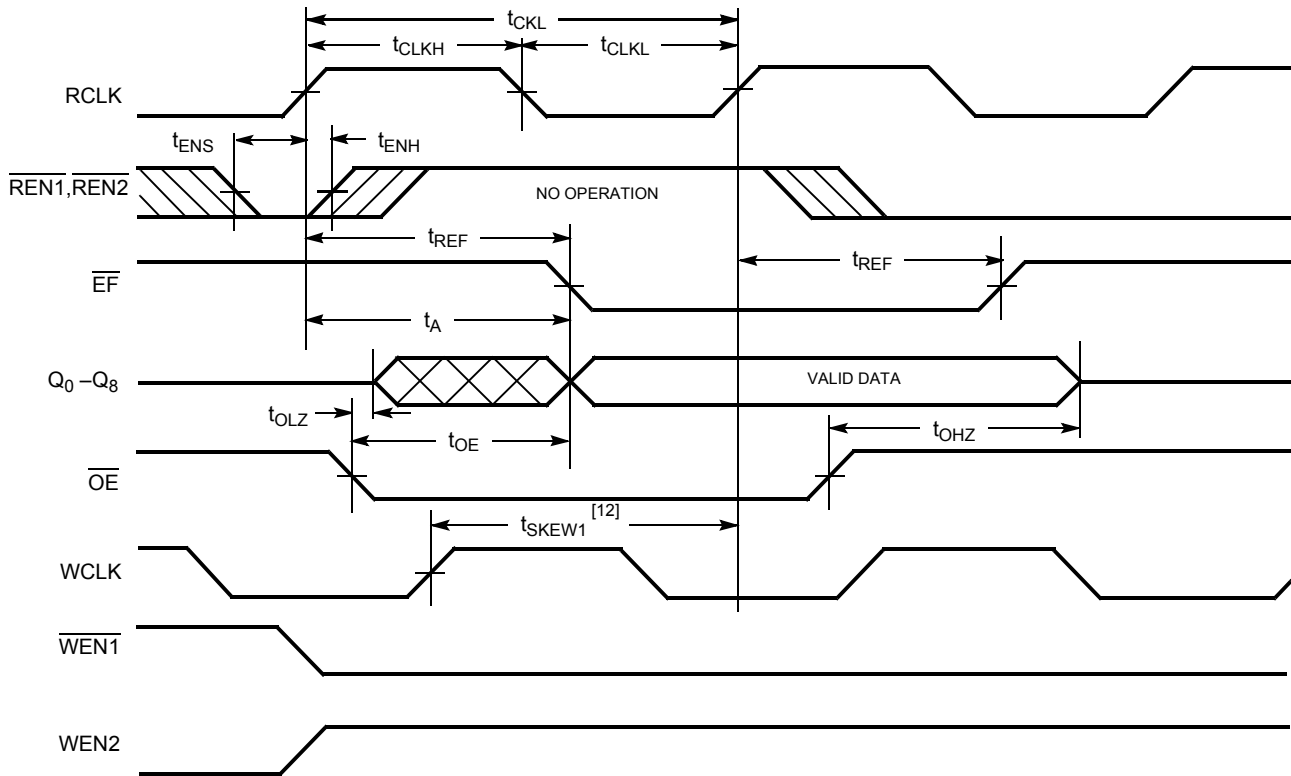

Note

11. t_{SKEW1} is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that \overline{FF} will go HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than t_{SKEW1} , then \overline{FF} may not change state until the next WCLK rising edge.

Switching Waveforms (continued)

Figure 6. Read Cycle Timing

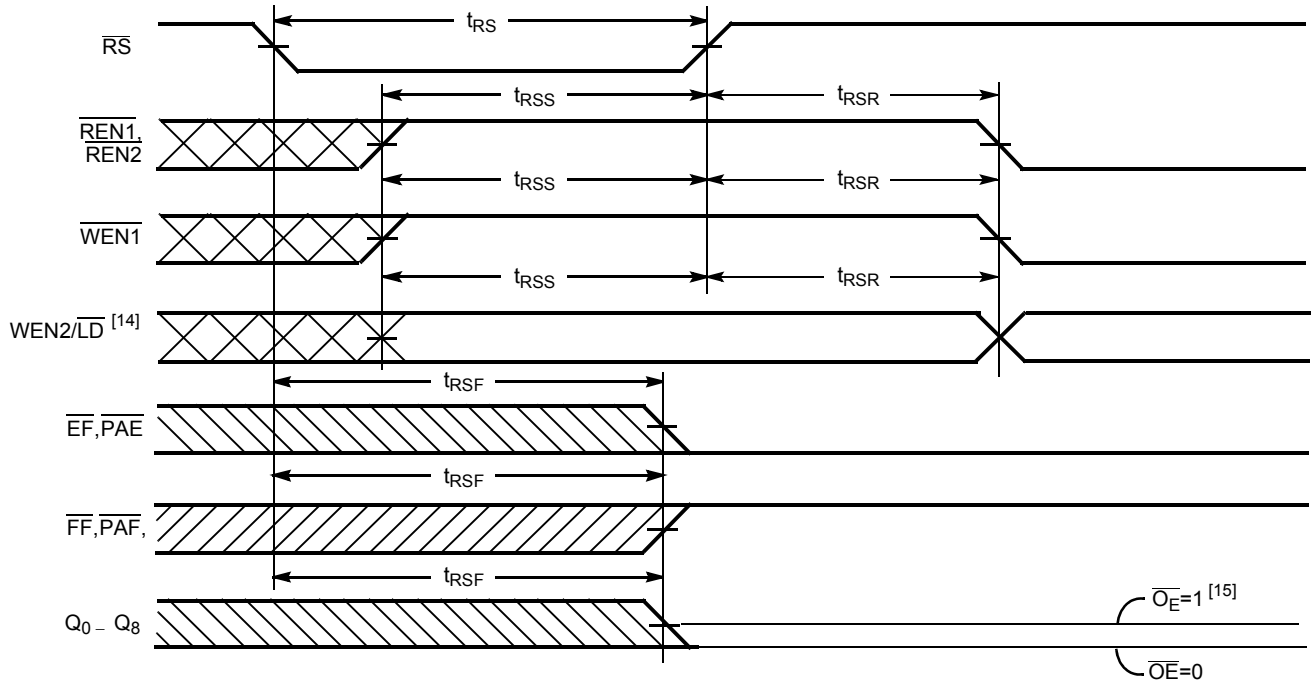

Note

¹². t_{SKEW1} is the minimum time between a rising WCLK edge and a rising RCLK edge to guarantee that \overline{EF} will go HIGH during the current clock cycle. If the time between the rising edge of WCLK and the rising edge of RCLK is less than t_{SKEW1} , then \overline{EF} may not change state until the next RCLK rising edge.

Switching Waveforms (continued)

Figure 7. Reset Timing ^[13]

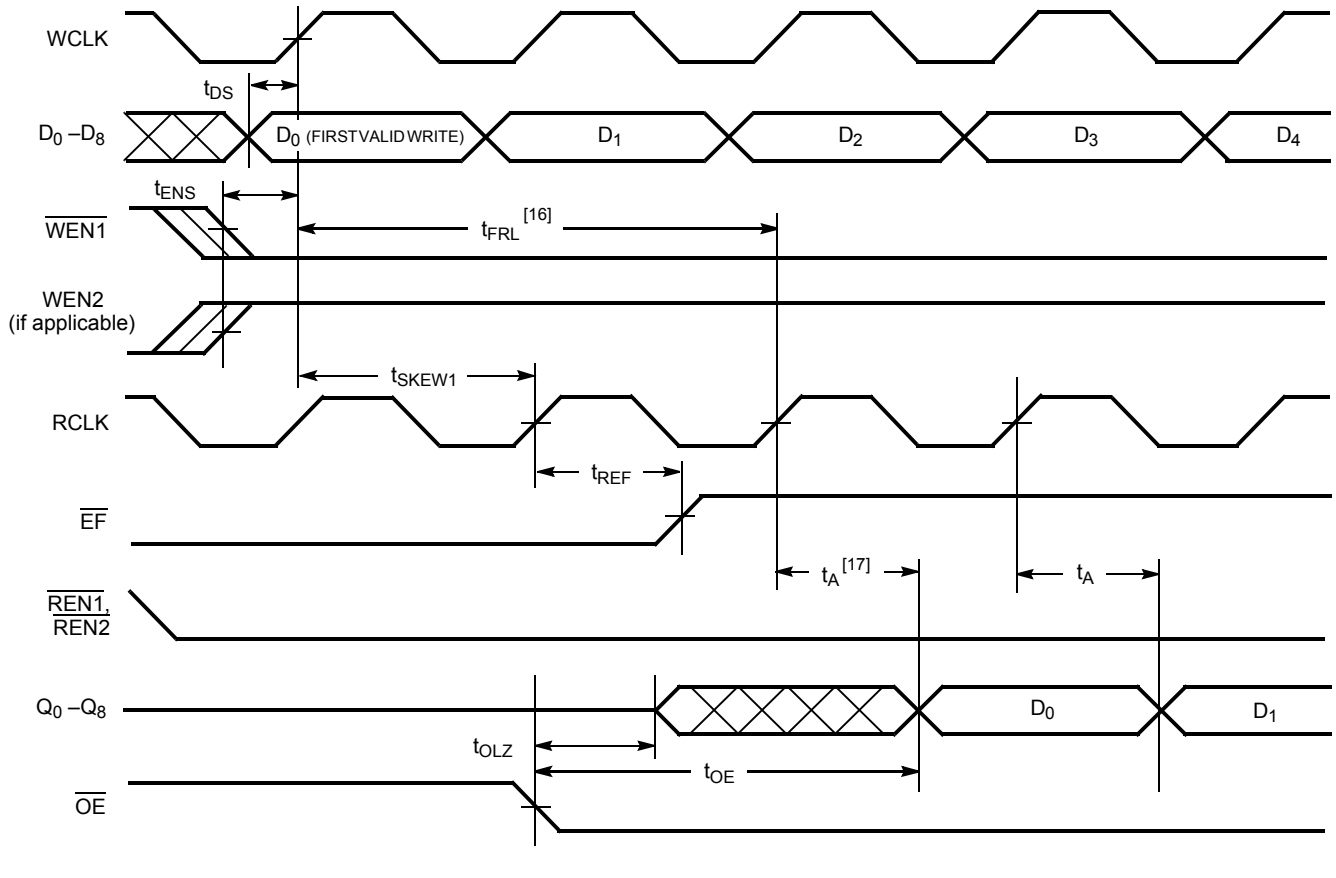

Notes

13. The clocks (RCLK, WCLK) can be free-running during reset.

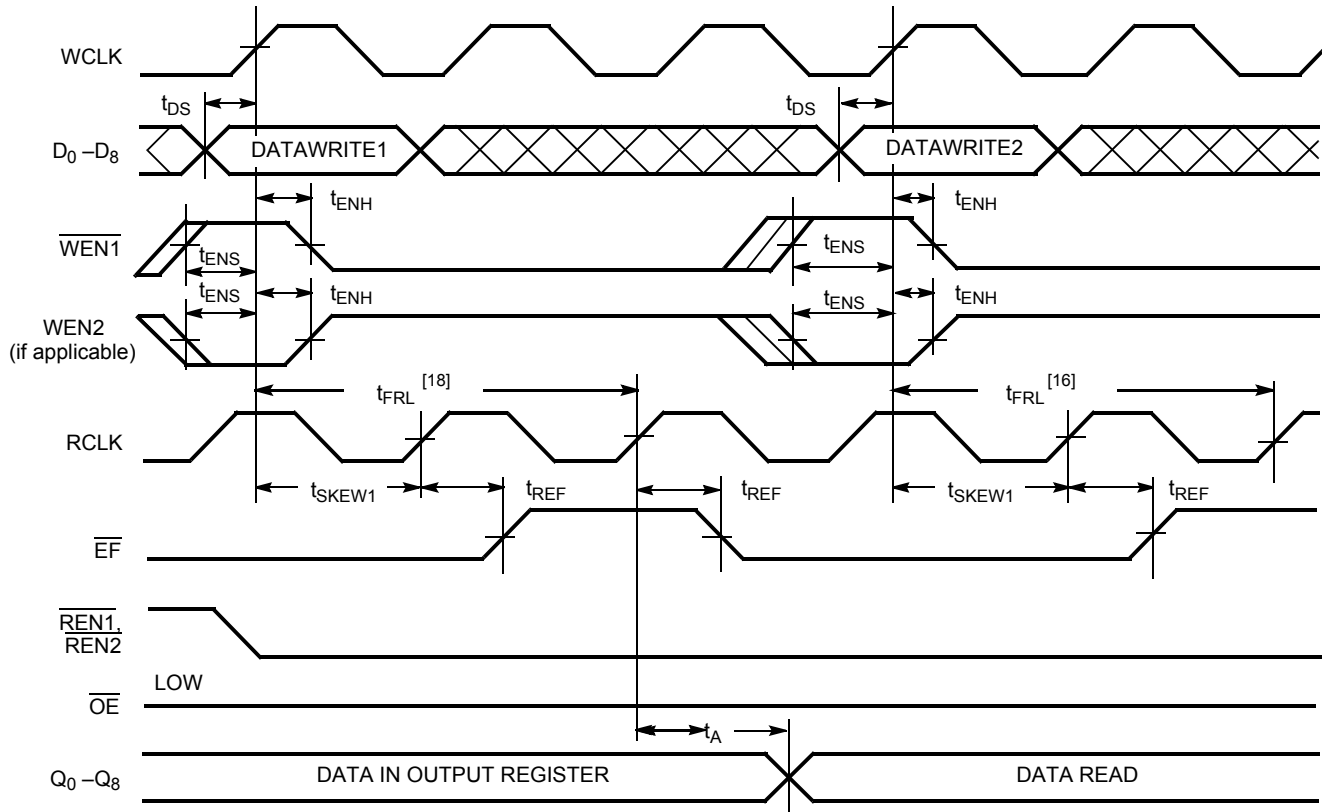

14. Holding WEN2/LD HIGH during reset will make the pin act as a second enable pin. Holding WEN2/LD LOW during reset will make the pin act as a load enable for the programmable flag offset registers.

15. After reset, the outputs will be LOW if $\overline{OE} = 0$ and three-state if $\overline{OE} = 1$.

Switching Waveforms (continued)

Figure 8. First Data Word Latency after Reset with Simultaneous Read and Write

Notes

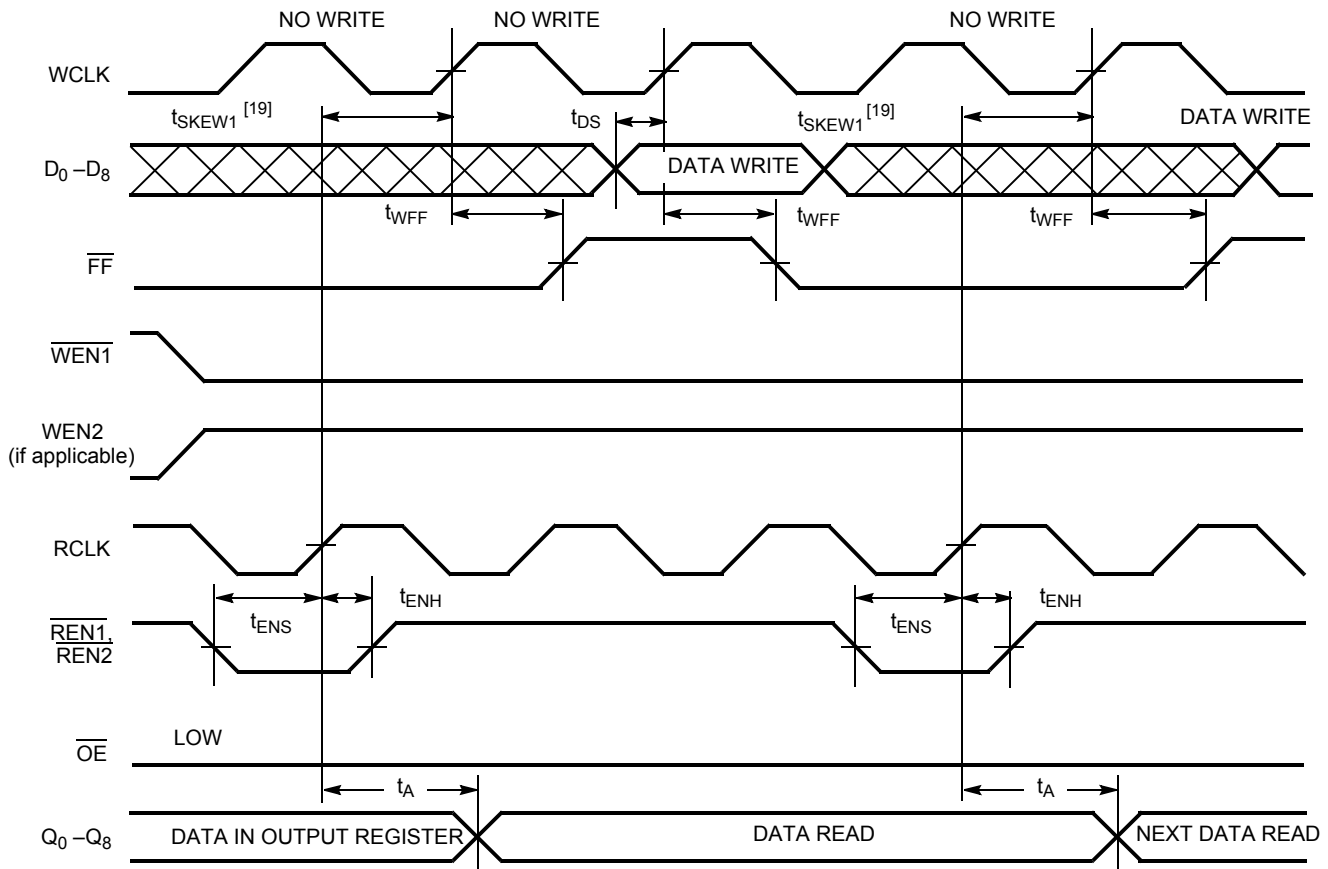

16. When $t_{SKEW1} \geq$ minimum specification, t_{FRL} (maximum) = $t_{CLK} + t_{SKEW1}$. When $t_{SKEW1} <$ minimum specification, t_{FRL} (maximum) = either $2 \cdot t_{CLK} + t_{SKEW1}$ or $t_{CLK} + t_{SKEW1}$. The Latency Timing applies only at the Empty Boundary (\overline{EF} = LOW).
17. The first word is available the cycle after \overline{EF} goes HIGH, always.

Switching Waveforms (continued)
Figure 9. Empty Flag Timing

Note

18. When $t_{SKEW1} \geq$ minimum specification, t_{FRL} (maximum) = $t_{CLK} + t_{SKEW1}$. When $t_{SKEW1} <$ minimum specification, t_{FRL} (maximum) = either $2 \cdot t_{CLK} + t_{SKEW1}$ or $t_{CLK} + t_{SKEW1}$. The Latency Timing applies only at the Empty Boundary (EF = LOW).

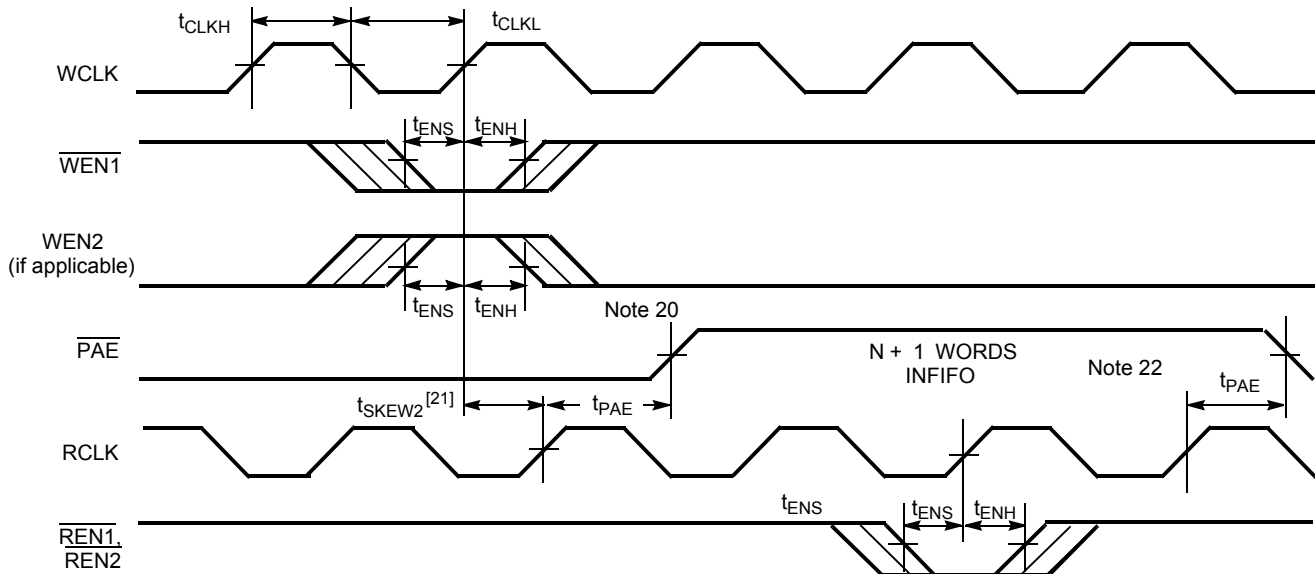

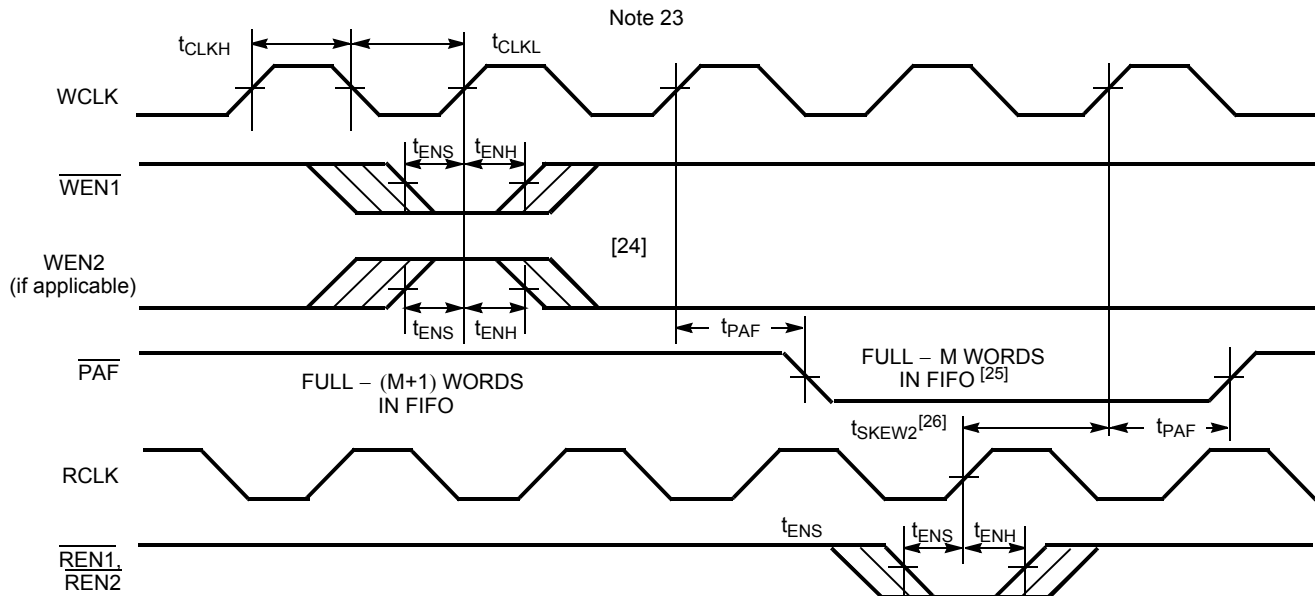

Switching Waveforms (continued)

Figure 10. Full Flag Timing

Note

19. t_{SKEW1} is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that \overline{FF} will go HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than t_{SKEW1} , then \overline{FF} may not change state until the next WCLK rising edge.

Switching Waveforms (continued)
Figure 11. Programmable Almost Empty Flag Timing

Figure 12. Programmable Almost Full Flag Timing

Notes

20. PAE offset = n.

21. t_{SKEW2} is the minimum time between a rising WCLK and a rising RCLK edge for \overline{PAE} to change state during that clock cycle. If the time between the edge of WCLK and the rising RCLK is less than t_{SKEW2} , then PAE may not change state until the next RCLK.

22. If a read is performed on this rising edge of the read clock, there will be Empty + (n-1) words in the FIFO when \overline{PAE} goes LOW.

23. If a write is performed on this rising edge of the write clock, there will be Full - (m-1) words of the FIFO when \overline{PAF} goes LOW.

24. PAF offset = m.

25. 256-m words in FIFO for CY7C4201V, 512-m words for CY7C4211V

26. t_{SKEW2} is the minimum time between a rising RCLK edge and a rising WCLK edge for \overline{PAF} to change during that clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than t_{SKEW2} , then PAF may not change state until the next WCLK.

© Cypress Semiconductor Corporation, 2001-2015. The information contained herein is subject to change without notice. Cypress Semiconductor Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in a Cypress product. Nor does it convey or imply any license under patent or other rights. Cypress products are not warranted nor intended to be used for medical, life support, life saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress. Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Any Source Code (software and/or firmware) is owned by Cypress Semiconductor Corporation (Cypress) and is protected by and subject to worldwide patent protection (United States and foreign), United States copyright laws and international treaty provisions. Cypress hereby grants to licensee a personal, non-exclusive, non-transferable license to copy, use, modify, create derivative works of, and compile the Cypress Source Code and derivative works for the sole purpose of creating custom software and or firmware in support of licensee product to be used only in conjunction with a Cypress integrated circuit as specified in the applicable agreement. Any reproduction, modification, translation, compilation, or representation of this Source Code except as specified above is prohibited without the express written permission of Cypress.

Disclaimer: CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes without further notice to the materials described herein. Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.
