16-Bit Registered Transceiver with 3-STATE Outputs

General Description

The ABT16543 16-bit transceiver contains two sets of D-type latches for temporary storage of data flowing in either direction. Separate Latch Enable and Output Enable inputs are provided for each register to permit independent control of inputting and outputting in either direction of data flow. Each byte has separate control inputs, which can be shorted together for full 16-bit operation.

Features

- Back-to-back registers for storage
- Bidirectional data path
- A and B outputs have current sourcing capability of 32 mA and current sinking capability of 64 mA
- Separate control logic for each byte
- 16-bit version of the ABT543
- Separate controls for data flow in each direction
- Guaranteed latchup protection
- High impedance glitch free bus loading during entire power up and power down cycle
- Nondestructive hot insertion capability

Functional Description

The ABT16543 contains two sets of D-type latches, with separate input and output controls for each. For data flow from A to B, for example, the A to B Enable (CEAB) input must be low in order to enter data from the A port or take data from the B-Port as indicated in the Data I/O Control Table. With CEAB low, a low signal on (LEAB) input makes the A to B latches transparent; a subsequent low to high transition of the LEAB line puts the A latches in the storage

mode and their outputs no longer change with the A inputs. With CEAB and OEAB both low, the B output buffers are active and reflect the data present on the output of the A latches. Control of data flow from B to A is similar, but using the CEBA, LEBA and OEBA. Each byte has separate control inputs, allowing the device to be used as two 8-bit transceivers or as one 16-bit transceiver.
