Features

- Fast Read Access Time 100 ns
- Dual Voltage Range Operation

Unregulated Battery Power Supply Range, 2.7V to 3.6V or Standard 5V \pm 10% Supply Range

- Compatible with JEDEC Standard AT27C020
- Low Power CMOS Operation

20 $\,\mu$ A max. (less than 1 $\,\mu$ A typical) Standby for V_{CC} = 3.6V 29 mW max. Active at 5 MHz for V_{CC} = 3.6V

- Wide Selection of JEDEC Standard Packages
 - 32-Lead PLCC
 - 32-Lead TSOP
- High Reliability CMOS Technology
 - 2,000V ESD Protection
 - 200 mA Latchup Immunity
- Rapid[™] Programming Algorithm 100 µs/byte (typical)
- CMOS and TTL Compatible Inputs and Outputs
 - JEDEC Standard for LVTTL and LVBO
- Integrated Product Identification Code
- Commercial and Industrial Temperature Ranges

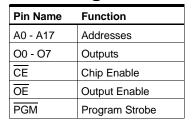

Description

The AT27BV020 is a high performance, low power, low voltage 2,097,152 bit one-time programmable read only memory (OTP EPROM) organized as 256K by 8 bits. It requires only one supply in the range of 2.7 to 3.6V in normal read mode operation, making it ideal for fast, portable systems using either regulated or unregulated battery power.

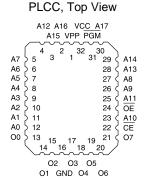

Atmel's innovative design techniques provide fast speeds that rival 5V parts while keeping the low power consumption of a 3V supply. At V_{CC} = 2.7V, any byte can be accessed in less than 100 ns. With a typical power dissipation of only 18 mW at 5 MHz and V_{CC} = 3V, the AT27BV020 consumes less than one fifth the power of a standard 5V EPROM. Standby mode supply current is typically less than 1 μ A at 3V. The AT27BV020 simplifies system design and stretches battery lifetime even further by eliminating the need for power supply regulation.

Description (Continued)

The AT27BV020 is available in industry standard JEDEC approved one-time programmable (OTP) plastic PLCC and TSOP packages. All devices feature two-line control (CE, OE) to give designers the flexibility to prevent bus contention.

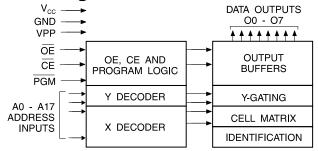

The AT27BV020 operating with V_{CC} at 3.0V produces TTL level outputs that are compatible with standard TTL logic devices operating at V_{CC} = 5.0V. At V_{CC} = 2.7V, the part is compatible with JEDEC approved low voltage battery operation (LVBO) interface specifications. The device is also capable of standard 5-volt operation making it ideally suited for dual supply range systems or card products that are pluggable in both 3-volt and 5-volt hosts.

Atmel's AT27BV020 has additional features to ensure high quality and efficient production use. The Rapid[™] Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 μs/byte. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages. The AT27BV020 programs exactly the same way as a standard 5V AT27C020 and uses the same programming equipment.

System Considerations

Switching between active and standby conditions via the Chip Enable pin may produce transient voltage excursions. Unless accommodated by the system design, these transients may exceed data sheet limits, resulting in device non-conformance. At a minimum, a 0.1 μF high frequency, low inherent inductance, ceramic capacitor should be utilized for each device. This capacitor should be connected between the Vcc and Ground terminals of the device, as close to the device as possible. Additionally, to stabilize the supply voltage level on printed circuit boards with large EPROM arrays, a 4.7 μF bulk electrolytic capacitor should be utilized, again connected between the Vcc and Ground terminals. This capacitor should be positioned as close as possible to the point where the power supply is connected to the array.

Block Diagram

Absolute Maximum Ratings*

Temperature Under Bias40°C to +85°C
Storage Temperature65°C to +125°C
Voltage on Any Pin with Respect to Ground2.0V to +7.0V (1)
Voltage on A9 with Respect to Ground2.0V to +14.0V (1)
V _{PP} Supply Voltage with Respect to Ground2.0V to +14.0V ⁽¹⁾

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. Minimum voltage is -0.6V dc which may undershoot to -2.0V for pulses of less than 20 ns. Maximum output pin voltage is V_{CC} + 0.75V dc which may be exceeded if certain precautions are observed (consult application notes) and which may overshoot to +7.0V for pulses of less than 20 ns.

Operating Modes

· •							
Mode \ Pin	CE	ŌE	PGM	Ai	Vpp	Vcc	Outputs
Read (2)	VIL	VIL	X ⁽¹⁾	Ai	Х	Vcc (2)	Dout
Output Disable (2)	Х	VIH	Х	Х	Х	Vcc (2)	High Z
Standby (2)	VIH	Х	Χ	Χ	Χ	Vcc (2)	High Z
Rapid Program (3)	VIL	VIH	VIL	Ai	V_PP	Vcc (3)	DIN
PGM Verify ⁽³⁾	V_{IL}	V_{IL}	V_{IH}	Ai	V_{PP}	Vcc (3)	D _{OUT}
PGM Inhibit (3)	V_{IH}	Χ	Χ	X	V_PP	Vcc (3)	High Z
Product Identification (3, 5)	V_{IL}	V_{IL}	Х	A9 = V _H ⁽⁴⁾ A0 = V _{IH} or V _{IL} A1 - A17 = V _{IL}	X	Vcc (3)	Identification Code

Notes: 1. X can be V_{IL} or V_{IH}.

- 2. Read, output disable, and standby modes require, $2.7V \le V_{CC} \le 3.6V$, or $4.5V \le V_{CC} \le 5.5V$.
- 3. Refer to Programming Characteristics. Programming modes require $V_{CC} = 6.5V$.
- 4. $V_H = 12.0 \pm 0.5 V$.
- 5. Two identifier bytes may be selected. All Ai inputs are held low (V_{IL}), except A9 which is set to V_H and A0 which is toggled low (V_{IL}) to select the Manufacturer's Identification byte and high (V_{IH}) to select the Device Code byte.

= Preliminary Information

AC Waveforms for Read Operation (1)

- Notes: 1. Timing measurement references are 0.8V and 2.0V. Input AC drive levels are 0.45V and 2.4V, unless otherwise specified.
 - 2. OE may be delayed up to tce toe after the falling edge of $\overline{\text{CE}}$ without impact on t_{CE}.
 - 3. OE may be delayed up to tACC tOE after the address is valid without impact on tACC.
- 4. This parameter is only sampled and is not 100% tested.
- 5. Output float is defined as the point when data is no longer driven.

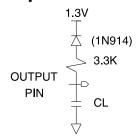

Input Test Waveform and Measurement Level

 t_R , $t_F < 20$ ns (10% to 90%)

Output Test Load

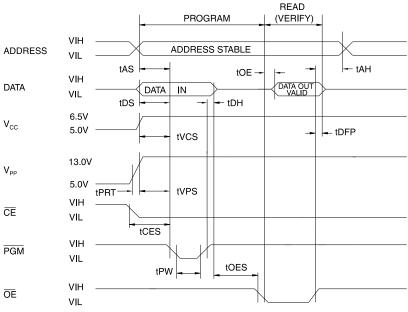

Note: CL = 100 pF including jig capacitance.

Pin Capacitance (f = 1 MHz, T = 25°C) (1)

	Тур	Max	Units	Conditions
CIN	4	8	pF	$V_{IN} = 0V$
Соит	8	12	pF	Vout = 0V

Note: 1. Typical values for nominal supply voltage. This parameter is only sampled and is not 100% tested.

Programming Waveforms (1)

Notes: 1. The Input Timing Reference is 0.8V for V_{IL} and 2.0V for V_{IH} .

- 2. t_{OE} and t_{DFP} are characteristics of the device but must be accommodated by the programmer.
- 3. When programming the AT27BV020 a 0.1 μF capacitor is required across V_{PP} and ground to suppress spurious voltage transients.

DC Programming Characteristics

 T_{A} = 25 \pm 5°C, V_{CC} = 6.5 \pm 0.25V, V_{PP} = 13.0 \pm 0.25V

- Notes: 1. V_{CC} must be applied simultaneously or before V_{PP} and removed simultaneously or after VPP.
 - 2. This parameter is only sampled and is not 100% tested. Output Float is defined as the point where data is no longer driven —see timing diagram.
 - 3. Program Pulse width tolerance is 100 μ sec \pm 5%.

Atmel's 27BV020 Integrated (1) Product Identification Code

		Pins						Hex		
Codes	A0	07	O6	O5	04	О3	O2	O1	00	Data
Manufacturer	0	0	0	0	1	1	1	1	0	1E
Device Type	1	1	0	0	0	0	1	1	0	86

1. The AT27BV020 has the same Product Identification Code as the AT27C020. Both are programming

compatible.

Rapid Programming Algorithm

A 100 us PGM pulse width is used to program. The address is set to the first location. VCC is raised to 6.5V and V_{PP} is raised to 13.0V. Each address is first programmed with one 100 μs PGM pulse without verification. Then a verification/reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive 100 µs pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the next address is selected until all have been checked. VPP is then lowered to 5.0V and VCC to 5.0V. All bytes are read again and compared with the original data to determine if the device passes or fails.
