

80V, 300mA Three Phase High Side Driver

The HIP4083 is a three phase high side N-channel MOSFET driver, specifically targeted for PWM motor control. Two HIP4083 may be used together for 3 phase full bridge applications (see application block diagram). Alternatively, the lower gates may be controlled directly from a buffered microprocessor output.

Unlike other members of the HIP408x family, the HIP4083 has no built in turn-on delay. Each output (AHO, BHO, and CHO) will turn-on 65ns after its input is switched low. Likewise, each output will turn-off 60ns after its input is switched high. Very short and very long dead times are possible when two HIP4083 are used to drive a full bridge. This dead time is controlled by the input signal timing.

The HIP4083 does not have a built in charge pump. Therefore, the bootstrap capacitors must be recharged on a periodic basis by initiating a short refresh pulse. In most bridge applications, this will happen automatically every time the lower FETs turn-on and the upper FETs turn-off. However, it is still possible to use the HIP4083 in applications that require the high side FETs to be on for extended periods of time. This can be easily accomplished by sending a short refresh pulse to the DIS pin.

The HIP4083 has reduced drive current compared to the HIP4086 making it ideal for low to moderate power applications. The HIP4083 is optimized for applications where size and cost are important. For high power applications driving large power FETs, the HIP4086 is recommended.

Pinout

Features

- Independently Drives Three High Side N-Channel MOSFETs in Three Phase Bridge Configuration
- Bootstrap Supply Max Voltage to 95VDC
- Bias Supply Operation from 7V to 15V
- Drives 1000pF Load with Typical Rise Times of 35ns and Fall Times of 30ns
- CMOS/TTL Compatible Inputs
- Programmable Undervoltage Protection
- Pb-free Available

Applications

- Brushless Motors
- High Side Switches
- AC Motor Drives
- Switched Reluctance Motor Drives

Ordering Information

PART NUMBER	TEMP. RANGE (°C)	PACKAGE	PKG. DWG. #
HIP4083AB	-40 to 105	16 Ld SOIC	M16.15
HIP4083ABZ (Note)	-40 to 105	16 Ld SOIC (Pb-free)	M16.15
HIP4083AP	-40 to 105	16 Ld PDIP	E16.3
HIP4083APZ (Note)	-40 to 105	16 Ld PDIP (Pb-free)	E16.3

NOTE: Intersil Pb-free products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which is compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J Std-020B.

X	1	X	0
X	X	1	0
1	0	0	0
0	0	0	1

NOTE: X signifies that input can be either a "1" or "0".

Typical Application: Three Phase Bridge Driver with Programmable Dead Time

Typical Application: High Side Switch

Pin Descriptions

PIN NUMBER	SYMBOL	DESCRIPTION
6 11 16	AHB BHB CHB (xHB)	Gate driver supplies. One external bootstrap diode and one capacitor are required for each. The bootstrap diode and capacitor may be omitted when the HIP4083 is used to drive the lower gates in three phase full bridge applications. In this case, tie all three xHB pins to V_{DD} and tie the xHS pins to the sources of the lower FETs. In full bridge applications, the lower FETs must be turned on first at start up to refresh the bootstrap capacitors. In high side switch applications, the load will keep xHS low and refresh should happen automatically at start up.
1 2 3	AHI BHI CHI (xHI)	Logic level inputs. Logic at these three pins controls the three output drivers, AHO, BHO and CHO. When $\overline{xHI}$ is low, xHO is high. When $\overline{xHI}$ is high, xHO is low. DIS (Disable) overrides all input signals. $\overline{xHI}$ can be driven by signal levels of 0V to 15V (no greater than V_{DD}).
5	V_{SS}	Chip ground.
13	UVLO	Undervoltage setting. A resistor can be connected between this pin and V_{SS} to program the under voltage set point - see Figure 7. With this pin not connected the undervoltage set point is typically 7V. When this pin is tied to V_{DD} , the undervoltage set point is typically 6.2V.
4	DIS	Disable input. Logic level input that when taken high sets all three outputs low. DIS high overrides all other inputs. When DIS is taken low the outputs are controlled by the other inputs. DIS can be driven by signal levels of 0V to 15V (no greater than V_{DD}).
7 10 15	AHO BHO CHO (xHO)	Gate connections. Connect to the gates of the power MOSFETs in each phase.
8 9 14	AHS BHS CHS (xHS)	MOSFET source connection. Connect the sources of the power MOSFETs and the negative side of the bootstrap capacitors to these pins. In high side switch applications, 2mA of current will flow out of these pins into the load when the upper FETs are off. This current is necessary to guarantee that the upper FETs stay off. This current tends to pull xHS high. For proper refresh, the load must pull the voltage on xHS down to at least 7V below V_{DD} . For example, when $V_{DD} = 12V$, xHS must be pulled down to 5V. Therefore, the minimum load necessary for proper refresh is given by the following equation: $R_{MIN} = 5V/2mA = 2.5k\Omega$. So in this case, if the load has an impedance less than $5k\Omega$, refresh will happen automatically at start up.
12	V_{DD}	Positive supply rail. Bypass this pin to V_{SS} with a capacitor $\geq 1\mu F$. In applications where the bus voltage and chip V_{DD} are at the same potential, it is a good idea to run a separate line from the supply to each. This greatly simplifies the filtering requirements.

Absolute Maximum Ratings $T_A = 25^\circ\text{C}$

Supply Voltage, V_{DD} -0.3V to 16V
 Logic I/O Voltages -0.3V to $V_{DD} + 0.3\text{V}$
 Voltage on xHS -6V (Transient) to 85V (-40°C to 150°C)
 Voltage on xHB $V_{xHS} - 0.3\text{V}$ to $V_{xHS} + V_{DD}$
 Voltage on xLO $V_{SS} - 0.3\text{V}$ to $V_{DD} + 0.3\text{V}$
 Voltage on xHO $V_{xHS} - 0.3\text{V}$ to $V_{xHB} + 0.3\text{V}$
 Phase Slew Rate 20V/ns

Thermal Information

Thermal Resistance (Typical, Note 1) θ_{JA} ($^\circ\text{C}/\text{W}$)
 SOIC Package 100
 DIP Package 80
 Maximum Storage Temperature Range -65°C to 150°C
 Maximum Junction Temperature 150°C
 Maximum Lead Temperature (Soldering 10s) 300°C
 (SOIC - Lead Tips Only)

Operating Conditions

Supply Voltage, V_{DD} +7.0V to +15V
 Voltage on xHS 0V to 80V
 Voltage on xHB $V_{xHS} + V_{DD}$
 Operating Ambient Temperature Range -40°C to 125°C

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

1. θ_{JA} is measured with the component mounted on an evaluation PC board in free air.
2. All voltages are relative to V_{SS} unless otherwise specified.
3. x = A, B and C. For example, xHS refers to AHS, BHS and CHS.

Electrical Specifications $V_{DD} = V_{xHB} = 12\text{V}$, $V_{SS} = V_{xHS} = 0\text{V}$, Gate Capacitance (C_{GATE}) = 1000pF, $R_{UV} = \infty$

NOTES:

1. Controlling Dimensions: INCH. In case of conflict between English and Metric dimensions, the inch dimensions control.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication No. 95.
4. Dimensions A, A1 and L are measured with the package seated in JEDEC seating plane gauge GS-3.
5. D, D1, and E1 dimensions do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010 inch (0.25mm).
6. E and e_A are measured with the leads constrained to be perpendicular to datum $-C-$.
7. e_B and e_C are measured at the lead tips with the leads unconstrained. e_C must be zero or greater.
8. B1 maximum dimensions do not include dambar protrusions. Dambar protrusions shall not exceed 0.010 inch (0.25mm).
9. N is the maximum number of terminal positions.
10. Corner leads (1, N, N/2 and N/2 + 1) for E8.3, E16.3, E18.3, E28.3, E42.6 will have a B1 dimension of 0.030 - 0.045 inch (0.76 - 1.14mm).

NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width "B", as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch).
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.

All Intersil U.S. products are manufactured, assembled and tested utilizing ISO9000 quality systems.
