

LOW DROPOUT VOLTAGE REGULATOR

■ GENERAL DESCRIPTION

NJU7771/72/73/74/75/76 is a low dropout voltage regulator designed for portable items.

Advanced CMOS technology achieves high ripple rejection and low quiescent current.

NJU7774/75/76 features shunt switch which improves turn off response of output voltage when ON/OFF control is used.

■ PACKAGE OUTLINE

NJU777*F

■ FEATURES

- High Ripple Rejection 65dB typ. (f=1kHz, Vo=3.0V version)
- Low quiescent Current Iq=18μA (Io=0mA)
- Output capacitor with 1.0μF ceramic capacitor (Vo>2.0V version)
- Output Current Io(max.)=150mA
- High Precision Output Vo±1.0%
- Low Dropout Voltage 0.15V typ. (Io=100mA, Vo=3.0V)
- Input Voltage Range VIN=+2.3V~9V (Vo≤2.0V version)
- ON/OFF Control (Active High)
- With Shunt Switch Only NJU7774/75/76
- Internal Short Circuit Current Limit
- Internal Thermal Overload Protection
- CMOS Technology
- Package Outline SOT-23-5

■ TYPICAL APPLICATION

① In case that ON/OFF Control is not required:

*8 $V_O \leq 2.0V$ version: $C_O = 2.2\mu F$

Connect control terminal to V_{IN} terminal.

② In use of ON/OFF Control

*8 $V_O \leq 2.0V$ version: $C_O = 2.2\mu F$

State of control terminal:

- "H" → output is enabled.
- "L" or "open" → output is disabled.

*Input Capacitor C_{IN}

Input Capacitor C_{IN} is required to prevent oscillation and reduce power supply ripple for applications when high power supply impedance or a long power supply line.

Therefore, use the recommended C_{IN} value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and V_{IN} as shortest path as possible to avoid the problem.

*Output Capacitor C_O

Output capacitor (C_O) will be required for a phase compensation of the internal error amplifier.

The capacitance and the equivalent series resistance (ESR) influence to stable operation of the regulator.

Use of a smaller C_O may cause excess output noise or oscillation of the regulator due to lack of the phase compensation.

On the other hand, Use of a larger C_O reduces output noise and ripple output, and also improves output transient response when rapid load change.

Therefore, use the recommended C_O value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and V_{OUT} as shortest path as possible for stable operation

The recommended capacitance depends on the output voltage rank. Especially, low voltage regulator requires larger C_O value.

In addition, you should consider varied characteristics of capacitor (a frequency characteristic, a temperature characteristic, a DC bias characteristic and so on) and unevenness peculiar to a capacitor supplier enough.

When selecting C_O , recommend that have withstand voltage margin against output voltage and superior temperature characteristic though this product is designed stability works with wide range ESR of capacitor including low ESR products.
