

## EHHD015A0A Hammerhead™ Series; DC-DC Converter Power Modules

### 18-75Vdc Input; 5Vdc, 15.0A, 75W Output

### RoHS Compliant

### Applications

- Distributed Power Architectures
- Wireless Networks
- Access and Optical Network Equipment
- Industrial Equipment

### Options

- Negative Remote On/Off logic (preferred)
- Over current/Over temperature/Over voltage protections (Auto-restart) (preferred)
- Heat plate versions (-H)
- Surface Mount version (-S)

### Description

The EHHD015A0A [Hammerhead™] Series, eighth-brick, low-height power modules are isolated dc-dc converters which provide a single, precisely regulated output voltage over an ultra wide input voltage range of 18-75V<sub>dc</sub>. The EHHD015A0A provides 5V<sub>dc</sub> nominal output voltage rated for 15A<sub>dc</sub> output current. The module incorporates GE's vast heritage for reliability and quality, while also using the latest in technology, and component and process standardization to achieve highly competitive cost. The open frame module construction, available in both surface-mount and through-hole packaging, enable designers to develop cost and space efficient solutions. The module achieves typical full load efficiency greater than 90% at V<sub>IN</sub>=24V<sub>dc</sub> and V<sub>IN</sub>=48V<sub>dc</sub>. Standard features include remote On/Off, remote sense, output voltage adjustment, overvoltage, overcurrent and overtemperature protection. An optional heat plate allows for external standard, eighth-brick heat sink attachment to achieve higher output current in high temperature applications.

### Features

- Compliant to RoHS II EU "Directive 2011/65/EU (-Z versions)
- Compliant to REACH Directive (EC) No 1907/2006
- Flat and high efficiency curve
- Industry standard, DOSA compliant footprint  
57.9mm x 22.8mm x 7.6mm  
(2.28 in x 0.9 in x 0.30 in)
- Low profile height and reduced component skyline
- Ultra wide input voltage range: 18-75 V<sub>dc</sub>
- Tightly regulated output
- Remote sense
- Output Voltage adjust: 80% to 110% of V<sub>O,nom</sub>
- Constant switching frequency
- Positive remote On/Off logic
- Input under/over voltage protection
- Output overcurrent and overvoltage protection
- Overtemperature protection
- No reverse current during output shutdown
- Wide operating temperature range (-40°C to 85°C)
- Suitable for cold wall cooling using suitable Gap Pad applied directly to top side of module
- ANSI/UL\*60950-1-2011 and CAN/CSA† C22.2 No. 60950-1-07, Second Edition + A1:2011 (MOD), dated March 19, 2011; and DIN EN 60950-1 (VDE‡ 0805 Teil 1):2011-01; EN 60950-1:2006 + A11:2009 + A1:2010, DIN EN 60950-1/A12 (VDE 0805-1/A12):2011-08; EN 60950-1/A12:2011-02, IEC 60950-1(ed.2);am1:2009
- CE mark meets 2006/95/EC directive§
- Meets the voltage and current requirements for ETSI 300-132-2 and complies with and licensed for Basic insulation rating per EN60950-1
- 2250 Vdc Isolation tested in compliance with IEEE 802.3<sup>a</sup> PoE standards
- ISO\*\*9001 and ISO 14001 certified manufacturing facilities

### 18-75Vdc Input; 5Vdc, 15.0A, 75W Output

#### Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only, functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect the device reliability.

| Parameter  | Device  | Symbol         | Min  | Max  | Unit            |
|--|---------|----------------|------|------|-----------------|
| Input Voltage  |         |                |      |      |                 |
| Continuous   | All     | $V_{IN}$       | -0.3 | 80   | V <sub>dc</sub> |
| Transient, operational ( $\leq 100$ ms)  | All     | $V_{IN,trans}$ | -0.3 | 100  | V <sub>dc</sub> |
| Operating Ambient Temperature  | All     | $T_A$          | -40  | 85   | °C              |
| Maximum Heat Plate Operating Temperature<br>(see Thermal Considerations section) | -18H, H | $T_C$          | -40  | 105  | °C              |
| Storage Temperature  | All     | $T_{stg}$      | -55  | 125  | °C              |
| Altitude*  | All     |                |      | 4000 | m               |
| I/O Isolation voltage (100% factory Hi-Pot tested)                               | All     | —              | —    | 2250 | V <sub>dc</sub> |

\* For higher altitude applications, contact your GE Sales Representative for alternative conditions of use.

#### Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage, resistive load, and temperature conditions.

| Parameter  | Device | Symbol             | Min | Typ   | Max | Unit              |
|--|--------|--------------------|-----|-------|-----|-------------------|
| Operating Input Voltage  | All    | $V_{IN}$           | 18  | 24/48 | 75  | V <sub>dc</sub>   |
| Maximum Input Current<br>( $V_{IN} = V_{IN, min}$ to $V_{IN, max}$ , $V_O = V_{O, set}$ , $I_O = I_{O, max}$ )   | All    | $I_{IN}$           |     | 4.4   | 5.0 | A <sub>dc</sub>   |
| Input No Load Current<br>( $V_{IN} = 48V$ , $I_O = 0$ , module enabled)  | All    | $I_{IN, No load}$  |     | 70    |     | mA                |
| Input Stand-by Current<br>( $V_{IN} = 48V$ , module disabled)  | All    | $I_{IN, stand-by}$ |     | 5     | 8   | mA                |
| Inrush Transient   | All    | $I^2t$             |     |       | 0.5 | A <sup>2</sup> s  |
| Input Reflected Ripple Current, peak-to-peak<br>(5Hz to 20MHz, 1 $\mu$ H source impedance; $V_{IN, min}$ to $V_{IN, max}$ , $I_O = I_{O, max}$ ; See Test configuration section) | All    |                    |     | 30    |     | mA <sub>p-p</sub> |
| Input Ripple Rejection (120Hz)   | All    |                    |     | 50    |     | dB                |

#### CAUTION: This power module is not internally fused. An input line fuse must always be used.

This power module can be used in a wide variety of applications, ranging from simple standalone operation to an integrated part of sophisticated power architectures. To preserve maximum flexibility, internal fusing is not included, however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a fast-acting fuse with a maximum rating of 10 A (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data sheet for further information.

## Test Configurations

NOTE: Measure input reflected ripple current with a simulated source inductance ( $L_{TEST}$ ) of 12µH. Capacitor  $C_S$  offsets possible battery impedance. Measure current as shown above.

Figure 7. Input Reflected Ripple Current Test Setup.

NOTE: All voltage measurements to be taken at the module terminals, as shown above. If sockets are used then Kelvin connections are required at the module terminals to avoid measurement errors due to socket contact resistance.

Figure 8. Output Ripple and Noise Test Setup.

NOTE: All voltage measurements to be taken at the module terminals, as shown above. If sockets are used then Kelvin connections are required at the module terminals to avoid measurement errors due to socket contact resistance.

Figure 9. Output Voltage and Efficiency Test Setup.

$$\text{Efficiency } \eta = \frac{V_O \cdot I_O}{V_{IN} \cdot I_{IN}} \times 100 \%$$

## Design Considerations

### Input Filtering

The power module should be connected to a low ac-impedance source. Highly inductive source impedance can affect the stability of the power module. For the test configuration in Figure 7 a 33-100µF electrolytic capacitor (ESR<0.7Ω at 100kHz), mounted close to the power module helps ensure the stability of the unit. Consult the factory for further application guidelines.

### Safety Considerations

For safety-agency approval of the system in which the power module is used, the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standard, i.e. UL60950-1, CSA C22.2 No.60950-1, and VDE0805-1(IEC60950-1).

If the input source is non-SELV (ELV or a hazardous voltage greater than 60 Vdc and less than or equal to 75Vdc), for the module's output to be considered as meeting the requirements for safety extra-low voltage (SELV), all of the following must be true:

- The input source is to be provided with reinforced insulation from any other hazardous voltages, including the ac mains.
- One  $V_{IN}$  pin and one  $V_{OUT}$  pin are to be grounded, or both the input and output pins are to be kept floating.
- The input pins of the module are not operator accessible.
- Another SELV reliability test is conducted on the whole system (combination of supply source and subject module), as required by the safety agencies, to verify that under a single fault, hazardous voltages do not appear at the module's output.

**Note:** Do not ground either of the input pins of the module without grounding one of the output pins. This may allow a non-SELV voltage to appear between the output pins and ground.

The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

All flammable materials used in the manufacturing of these modules are rated 94V-0, or tested to the UL60950 A.2 for reduced thickness.

For input voltages exceeding -60 Vdc but less than or equal to -75 Vdc, these converters have been evaluated to the applicable requirements of BASIC INSULATION between secondary DC MAINS DISTRIBUTION input (classified as TNV-2 in Europe) and unearthed SELV outputs.

The input to these units is to be provided with a maximum 6 A fast-acting fuse in the ungrounded lead.

## EHHD015A0A Hammerhead™ Series; DC-DC Converter Power Modules

18-75Vdc Input; 5Vdc, 15.0A, 75W Output

### Feature Descriptions

#### Remote On/Off

Two remote on/off options are available. Positive logic turns the module on during a logic high voltage on the ON/OFF pin, and off during a logic low. Negative logic remote On/Off, device code suffix "1", turns the module off during a logic high and on during a logic low.

Figure 10. Remote On/Off Implementation.

To turn the power module on and off, the user must supply a switch (open collector or equivalent) to control the voltage ( $V_{on/off}$ ) between the ON/OFF terminal and the  $V_{IN(-)}$  terminal (see Figure 10). Logic low is  $0V \leq V_{on/off} \leq 1.2V$ . The maximum  $I_{on/off}$  during a logic low is 1mA; the switch should maintain a logic low level whilst sinking this current.

During a logic high, the typical maximum  $V_{on/off}$  generated by the module is 5V, and the maximum allowable leakage current at  $V_{on/off} = 5V$  is 1μA.

If not using the remote on/off feature:

For positive logic, leave the ON/OFF pin open.

For negative logic, short the ON/OFF pin to  $V_{IN(-)}$ .

#### Remote Sense

Remote sense minimizes the effects of distribution losses by regulating the voltage at the remote-sense connections (See Figure 11). The voltage between the remote-sense pins and the output terminals must not exceed the output voltage sense range given in the Feature Specifications table:

$$[V_O(+)-V_O(-)]-[SENSE(+)-SENSE(-)] \leq 0.5V$$

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim.

The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power (Maximum rated power =  $V_{o,set} \times I_{o,max}$ ).

Figure 11. Circuit Configuration for remote sense .

#### Input Undervoltage Lockout

At input voltages below the input undervoltage lockout limit, the module operation is disabled. The module will only begin to operate once the input voltage is raised above the undervoltage lockout turn-on threshold,  $V_{UV/ON}$ .

Once operating, the module will continue to operate until the input voltage is taken below the undervoltage turn-off threshold,  $V_{UV/OFF}$ .

#### Overtemperature Protection

To provide protection under certain fault conditions, the unit is equipped with a thermal shutdown circuit. The unit will shutdown if the thermal reference point,  $T_{ref}$ , exceeds 135 °C (Figure 13, typical) or 120 °C (Figure 14, typical), but the thermal shutdown is not intended as a guarantee that the unit will survive temperatures beyond its rating. The module will automatically restart upon cool-down to a safe temperature.

#### Output Overvoltage Protection

The output over voltage protection scheme of the modules has an independent over voltage loop to prevent single point of failure. This protection feature latches in the event of over voltage across the output. Cycling the on/off pin or input voltage resets the latching protection feature. If the auto-restart option (4) is ordered, the module will automatically restart upon an internally programmed time elapsing.

#### Overcurrent Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting continuously. At the point of current-limit inception, the unit enters hiccup mode. If the unit is not configured with auto-restart, then it will latch off following the over current condition. The module can be restarted by cycling the dc input power for at least one second or by toggling the remote on/off signal for at least one second.

## EHHD015A0A Hammerhead™ Series; DC-DC Converter Power Modules

18-75Vdc Input; 5Vdc, 15.0A, 75W Output

### Feature Descriptions (continued)

If the unit is configured with the auto-restart option (4), it will remain in the hiccup mode as long as the overcurrent condition exists; it operates normally, once the output current is brought back into its specified range. The average output current during hiccup is 10%  $I_{O,max}$ .

### Output Voltage Programming

Trimming allows the output voltage set point to be increased or decreased from the default value; this is accomplished by connecting an external resistor between the TRIM pin and either the  $V_O(+)$  pin or the  $V_O(-)$  pin.

**Figure 12. Circuit Configuration to Trim Output Voltage.**

Connecting an external resistor ( $R_{trim-down}$ ) between the TRIM pin and the  $V_O(-)$  (or Sense(-)) pin decreases the output voltage set point. To maintain set point accuracy, the trim resistor tolerance should be  $\pm 1.0\%$ .

The following equation determines the required external resistor value to obtain a percentage output voltage change of  $\Delta\%$

$$R_{trim-down} = \left[ \frac{511}{\Delta\%} - 10.22 \right] K\Omega$$

Where  $\Delta\% = \left( \frac{5.0V - V_{desired}}{5.0V} \right) \times 100$

For example, to trim-down the output voltage of the module by 6% to 4.7V,  $R_{trim-down}$  is calculated as follows:

$$\Delta\% = 6$$

$$R_{trim-down} = \left[ \frac{511}{6} - 10.22 \right] K\Omega$$

$$R_{trim-down} = 74.9 K\Omega$$

Connecting an external resistor ( $R_{trim-up}$ ) between the TRIM pin and the  $V_O(+)$  (or Sense(+)) pin increases the output voltage set point. The following equation determines the required external resistor value to obtain a percentage output voltage change of  $\Delta\%$ :

$$R_{trim-up} = \left[ \frac{5.11 \times 5.0 \times (100 + \Delta\%)}{1.225 \times \Delta\%} - \frac{511}{\Delta\%} - 10.22 \right] K\Omega$$

Where  $\Delta\% = \left( \frac{V_{desired} - 5.0}{5.0} \right) \times 100$

For example, to trim-up the output voltage of the module by 4% to 5.2V,  $R_{trim-up}$  is calculated as follows:

$$\Delta\% = 4$$

$$R_{trim-up} = \left[ \frac{5.11 \times 5.0 \times (100 + 4)}{1.225 \times 4} - \frac{511}{4} - 10.22 \right] K\Omega$$

$$R_{trim-up} = 404.3 K\Omega$$

The voltage between the  $V_O(+)$  and  $V_O(-)$  terminals must not exceed the minimum output overvoltage protection value shown in the Feature Specifications table. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment trim.

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim. The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power (Maximum rated power =  $V_{O,set} \times I_{O,max}$ ).

### Thermal Considerations

The power modules operate in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation.

Considerations include ambient temperature, airflow, module power dissipation, and the need for increased reliability. A reduction in the operating temperature of the module will result in an increase in reliability.

The thermal data presented here is based on physical measurements taken in a wind tunnel, using automated thermo-couple instrumentation to monitor key component temperatures: FETs, diodes, control ICs, magnetic cores, ceramic capacitors, opto-isolators, and module pwb conductors, while controlling the ambient airflow rate and temperature. For a given airflow and ambient temperature, the module output power is increased, until one (or more) of the components reaches its maximum derated operating temperature, as defined in IPC-9592. This procedure is then repeated for a different airflow or ambient temperature until a family of module output derating curves is obtained.

## EHHD015A0A Hammerhead™ Series; DC-DC Converter Power Modules

18-75Vdc Input; 5Vdc, 15.0A, 75W Output

### Thermal Considerations (continued)

The thermal reference points,  $T_{ref}$ , used in the specifications for open frame modules is shown in Figure 13. For reliable operation these temperatures should not exceed 125 °C.

Figure 13.  $T_{ref}$  Temperature Measurement Locations for Open Frame Module.

The thermal reference point,  $T_{ref}$ , used in the specifications for modules with heatplate is shown in Figure 14. For reliable operation this temperature should not exceed 105 °C.

Figure 14.  $T_{ref}$  Temperature Measurement Location for Module with Heatplate.

### Heat Transfer via Convection

Increased airflow over the module enhances the heat transfer via convection. Derating curves showing the maximum output current that can be delivered by each module versus local ambient temperature ( $T_A$ ) for natural convection and up to 3m/s (600 ft./min) forced airflow are shown in Figures 16 - 21.

Please refer to the Application Note "Thermal Characterization Process For Open-Frame Board-Mounted Power Modules" for a detailed discussion of thermal aspects including maximum device temperatures.

Figure 15. Thermal Resistance for the Open Frame Module; Airflow in the Transverse Direction from  $V_{out}(-)$  to  $V_{out}(+)$ ;  $V_{IN}$  = 24V or 48V,  $V_O$  = 5.0V.

Figure 16. Output Current Derating for the Open Frame Module; Airflow in the Transverse Direction from  $V_{out}(-)$  to  $V_{out}(+)$ ;  $V_{IN}$  = 48V,  $V_O$  = 5.0V.

Figure 17. Output Current Derating for the Module with Heatplate; Airflow in the Transverse Direction from  $V_{out}(-)$  to  $V_{out}(+)$ ;  $V_{IN}$  = 48V,  $V_O$  = 5.0V.

**Figure 20. Output Current Derating for the Module with Heatplate; Airflow in the Transverse Direction from  $V_{out(-)}$  to  $V_{out(+)}$ ;  $V_{IN}=24V$ ,  $V_O=5.0V$**

**Figure 21. Output Current Derating for the Module with -18 Heatplate; Airflow in the Transverse Direction from  $V_{out(-)}$  to  $V_{out(+)}$ ;  $V_{IN}=24V$ ,  $V_O=5.0V$**

## Heat Transfer via Conduction

The module can also be used in a sealed environment with cooling via conduction from the module's top surface through a gap pad material to a cold wall, as shown in Figure 22. This capability is achieved by insuring the top side component skyline profile achieves no more than 1mm height difference between the tallest and the shortest power train part that benefits from contact with the gap pad material. The output current derating versus cold wall temperature, when using a gap pad such as Bergquist GP2500S20, is shown in Figure 23.

**Figure 22. Cold Wall Mounting**

**Figure 23. Derated Output Current versus Cold Wall Temperature with local ambient temperature around module at 85°C;  $V_{IN}=24V$  or 48V.**

18-75Vdc Input; 5Vdc, 15.0A, 75W Output

### Through-Hole Soldering Information

#### Lead-Free Soldering

The EHHD015A0Axx RoHS-compliant through-hole products use SAC (Sn/Ag/Cu) Pb-free solder and RoHS-compliant components. They are designed to be processed through single or dual wave soldering machines. The pins have a RoHS-compliant finish that is compatible with both Pb and Pb-free wave soldering processes. A maximum preheat rate of 3°C/s is suggested. The wave preheat process should be such that the temperature of the power module board is kept below 210°C. For Pb solder, the recommended pot temperature is 260°C, while the Pb-free solder pot is 270°C max.

#### Paste-in-Hole Soldering

The EHHD015A0Axx module is compatible with reflow paste-in-hole soldering processes shown in Figures 25-27. Since the EHHD015A0AxxZ module is not packaged per J-STD-033 Rev.A, the module must be baked prior to the paste-in-hole reflow process. EHHD015A0Axx-HZ modules are not compatible with paste-in-hole reflow soldering. Please contact your GE Sales Representative for further information.

### Surface Mount Information

#### MSL Rating

The EHHD015A0A-SZ module has a MSL rating of 2a.

#### Storage and Handling

The recommended storage environment and handling procedures for moisture-sensitive surface mount packages is detailed in J-STD-033 Rev. A (Handling,

### Surface Mount Information (continued)

Packing, Shipping and Use of Moisture/Reflow Sensitive Surface Mount Devices). Moisture barrier bags (MBB) with desiccant are provided for the EHHD015A0Axx-SZ modules. These sealed packages should not be broken until time of use. Once the original package is broken, the floor life of the product at conditions of  $\leq 30^{\circ}\text{C}$  and 60% relative humidity varies according to the MSL rating (see J-STD-033A). The shelf life for dry packed SMT packages is a minimum of 12 months from the bag seal date, when stored at the following conditions:  $< 40^{\circ}\text{C}$ ,  $< 90\%$  relative humidity.

#### Pick and Place

The EHHD015A0A modules use an open frame construction and are designed for a fully automated assembly process. The modules are fitted with a label designed to provide a large surface area for pick and place operations. The label meets all the requirements for surface mount processing, as well as safety standards, and is able to withstand reflow temperatures of up to 300°C. The label also carries product information such as product code, serial number and the location of manufacture.

Figure 24. Pick and Place Location.

#### Nozzle Recommendations

The module weight has been kept to a minimum by using open frame construction. Even so, these modules have a relatively large mass when compared to conventional SMT components. Variables such as nozzle size, tip style, vacuum pressure and placement speed should be considered to optimize this process. The minimum recommended nozzle diameter for reliable operation is 6mm. The maximum nozzle outer diameter, which will safely fit within the allowable component spacing, is 9 mm.

Oblong or oval nozzles up to 11 x 9 mm may also be used within the space available.

#### Reflow Soldering Information

The surface mountable modules in the EHHD family use our newest SMT technology called "Column Pin" (CP) connectors. Figure 25 shows the new CP connector before and after reflow soldering onto the end-board assembly. The CP is constructed from a solid copper pin with an integral solder ball attached, which is composed of tin/lead (Sn/Pb) solder for non-Z codes, or Sn/Ag<sub>3</sub>/Cu (SAC) solder for -Z codes.

Figure 25. Column Pin Connector Before and After Reflow Soldering .

The CP connector design is able to compensate for large amounts of co-planarity and still ensure a reliable SMT solder joint. Typically, the eutectic solder melts at 183°C (Sn/Pb solder) or 217-218 °C (SAC solder), wets the land, and subsequently wicks the device connection. Sufficient time must be allowed to fuse the plating on the connection to ensure a reliable solder joint. There are several types of SMT reflow technologies currently used in the industry. These surface mount power modules can be reliably soldered using natural forced convection, IR (radiant infrared), or a combination of convection/IR. The following instructions must be observed when SMT soldering these units. Failure to observe these instructions may result in the failure of or cause damage to the modules, and can adversely affect long-term reliability.

## EHHD015A0A Hammerhead™ Series; DC-DC Converter Power Modules

18-75Vdc Input; 5Vdc, 15.0A, 75W Output

### Surface Mount Information (continued)

#### Tin Lead Soldering

The EHHD015A0A power modules are lead free modules and can be soldered either in a lead-free solder process or in a conventional Tin/Lead (Sn/Pb) process. It is recommended that the customer review data sheets in order to customize the solder reflow profile for each application board assembly. The following instructions must be observed when soldering these units. Failure to observe these instructions may result in the failure of or cause damage to the modules, and can adversely affect long-term reliability.

In a conventional Tin/Lead (Sn/Pb) solder process peak reflow temperatures are limited to less than 235°C. Typically, the eutectic solder melts at 183°C, wets the land, and subsequently wicks the device connection. Sufficient

time must be allowed to fuse the plating on the connection to ensure a reliable solder joint. There are several types of SMT reflow technologies currently used in the industry. These surface mount power modules can be reliably soldered using natural forced convection, IR (radiant infrared), or a combination of convection/IR. For reliable soldering the solder reflow profile should be established by accurately measuring the modules CP connector temperatures.

#### Lead Free Soldering

The -Z version of the EHHD015A0A modules are lead-free (Pb-free) and RoHS compliant and are both forward and backward compatible in a Pb-free and a SnPb soldering process. Failure to observe the instructions below may result in the failure of or cause damage to the modules and can adversely affect long-term reliability.

Figure 26. Reflow Profile for Tin/Lead (Sn/Pb) process.

Figure 27. Time Limit Curve Above 205°C for Tin/Lead (Sn/Pb) process

#### Pb-free Reflow Profile

Power Systems will comply with J-STD-015 Rev. C (Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices) for both Pb-free solder profiles and MSL classification procedures. This standard provides a recommended forced-air-convection reflow profile based on the volume and thickness of the package (table 4-2). The suggested Pb-free solder paste is Sn/Ag/Cu (SAC). The recommended linear reflow profile using Sn/Ag/Cu solder is shown in Figure 28.

Figure 28. Recommended linear reflow profile using Sn/Ag/Cu solder.

#### Post Solder Cleaning and Drying Considerations

Post solder cleaning is usually the final circuit-board assembly process prior to electrical board testing. The result of inadequate cleaning and drying can affect both the reliability of a power module and the testability of the finished circuit-board assembly. For guidance on appropriate soldering, cleaning and drying procedures, refer to GE Board

Mounted Power Modules: Soldering and Cleaning Application Note (AN04-001).

### Packaging Details

The surface mount versions of the EHHD015A0A (suffix -S) are supplied as standard in the plastic trays shown in Figure 30.

Each tray contains a total of 12 power modules. The trays are self-stacking and each shipping box for the EHHD015A0A (suffix -S) surface mount module will contain 4 full trays plus one empty hold down tray giving a total number of 48 power modules.

### Tray Specification

|                         |   |
