

High Performance Synchronous Buck EVM Using the TPS5210

User's Guide

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.

About This Manual

This User's Guide describes how to connect and evaluate a synchronous buck regulator using a TI TPS5210 Programmable Synchronous Buck Regulator Controller.

The User's Guide describes the TPS5210EVM-119 Buck Converter Evaluation Module (SLVP119) that provides a convenient method for evaluating the performance of a synchronous buck converter using the TPS5210 Ripple Regulator Controller designed to meet or exceed the Intel VRM8.3 DC-DC converter electrical specifications. A complete designed and tested power supply is presented. Test results can be found in *Designing Fast Response Synchronous Buck Regulators Using the TPS5210* Application Report, Literature Number SLVA044

How to Use This Manual

This document contains the following chapters:

- ☐ Chapter 1 Introduction
- ☐ Chapter 2 Schematic

FCC Warning

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

Introduction

This user's guide describes the TPS5210EVM-119 Synchronous Buck Converter Evaluation Module (SLVP119). The SLVP119 provides a convenient method for evaluating the performance of a synchronous buck converter using the TPS5210 Ripple Regulator Controller. The TPS5210 meets or exceeds the Intel VRM8.3 dc-dc converter electrical specifications. A complete designed and tested power supply is presented. The power supply is a programmable step-down dc-dc EVM that can deliver up to 20 A of continuous output current at a programmable output voltage from 1.3 V to 3.5 V determined by a 5 bit DAC code. The PWB board layout provides test points for viewing waveforms.

Topic	Page
1.1 Background	1-2
1.2 Performance Specification Summary	1-3
1.3 Voltage Identification Codes	1-4

1.1 Background

New high performance microprocessors may require from 40 to 80 watts of power for the CPU alone. Load current must be supplied with up to 30 A/ μ s slew rate while keeping the output voltage within tight regulation and response time tolerances. Parasitic interconnect impedances between the power supply and the processor must be kept to a minimum. Fast responding synchronous buck dc/dc converters controlled by the Texas Instruments TPS5210 hysteretic controller are ideally suited for microprocessor power applications requiring fast response and precise regulation to rapidly changing loads.

Conventional synchronous regulator control techniques include fixed frequency voltage-mode, fixed frequency current-mode, variable frequency current-mode, variable on-time, or variable off-time. CPU power supplies that are designed using these types of control methods require additional bulk storage capacitors on the output to maintain V_O within the regulation limits during the high di/dt load transients because of the limited bandwidth of the controller. Some controllers add a fast loop around the slower main control loop to improve the response time, but V_O must deviate outside a fixed tolerance band before the fast loop becomes active. The hysteretic control method employed by the TPS5210 offers superior performance with no requirements for additional output capacitance or difficult loop compensation design.

The TPS5210 controller was optimized for tight V_O regulation under static and dynamic load conditions for improved system efficiency. The TP5520 can operate in systems that derive main power from 12 V or 5 V.

1.2 Performance Specification Summary

This section summarizes the performance specifications of the SLVP119 converter. Table 1–1 gives the performance specifications of the converters.

Table 1–1. Performance Specification Summary

SPECIFICATION		TEST CONDITIONS	MIN	TYP	MAX	UNITS
Input voltage range	Main power (V_I)		4.5		13	V
	5-V input		4.5	5	5.5	V
	12-V input		11.4	12	13	V
Output voltage range		See Note 1	1.3	2	3.5	V
Static voltage tolerance		See Note 2	1.98	2	2.02	V
Line regulation		See Notes 1 and 3		±0.05%	±0.1%	
Load regulation		See Notes 4 and 5		±0.1%	±0.4%	
Transient response		See Note 6		±55		mV pk
				50		μsec
Output current range		See Note 3	0		20	A
Current limit		See Note 3	20			A
Output ripple		See Notes 3 and 5		35		mV
Soft-start risetime		See Note 4		10		ms
Operating frequency		See Notes 1 and 4		125		kHz
Efficiency, 10 A load		See Notes 2 and 4		90%		
Efficiency, 4 A load		See Notes 2 and 4		86%		

- Notes:**
- 1) $I_O = 12$ A.
 - 2) VID inputs set for $V_{REF} = 2$ V.
 - 3) Input voltage can be at any point over entire range.
 - 4) Input voltage adjusted to 12 Vdc.
 - 5) I_O can be at any point over entire range.
 - 6) I_O pulsed from 0 A to 16 A, $di/dt = 30$ A/μs.

1.3 Voltage Identification Codes

The output voltage is programmed by driving the 5 VID inputs. The output voltage for a given VID input is shown in Table 1–2.

Table 1–2. Voltage Identification Codes

VID Terminals (0 = GND, 1 = floating or pull-up to 5 V)					VREF
VID4	VID3	VID2	VID1	VID0	(Vdc)
0	1	1	1	1	1.30
