

LMZ14202 SIMPLE SWITCHER® 6V to 42V, 2A Power Module in Leaded SMT-TO Package

1 Features

- Integrated Shielded Inductor
- Simple PCB Layout
- Flexible Start-Up Sequencing Using External Soft-Start and Precision Enable
- Protection Against Inrush Currents and Faults Such as Input UVLO and Output Short Circuit
- Junction Temperature Range: -40°C to 125°C
- Single Exposed Pad and Standard Pinout for Easy Mounting and Manufacturing
- Fast Transient Response for Powering FPGAs and ASICs
- Low Output Voltage Ripple
- Pin-to-Pin Compatible Family:
 - LMZ14203/2/1 (42 V Maximum; 3 A, 2 A, 1 A)
 - LMZ12003/2/1 (20 V Maximum; 3 A, 2 A, 1 A)
- Fully Enabled for WEBENCH® Power Designer
- Electrical Specifications
 - 12-W Maximum Total Output Power
 - Up to 2-A Output Current
 - Input Voltage Range: 6 V to 42 V
 - Output Voltage Range: 0.8 V to 6 V
 - Efficiency up to 90%
- Performance Benefits
 - Operates at High Ambient Temperature With No Thermal Derating
 - High Efficiency Reduces System Heat Generation
 - Low Radiated Emissions (EMI) Tested With EN55022 Class B Standard
 - Low External Component Count

2 Applications

- Point of Load Conversions from 12-V and 24-V Input Rail
- Time-Critical Projects
- Space Constrained and High Thermal Requirement Applications Easy-To-Use, 7-Pin Package
- PFM 7-Pin Package
- Negative Output Voltage Applications (See AN-2027) [SNVA425](#)

3 Description

The LMZ14202, SIMPLE SWITCHER® power module is an easy-to-use step-down DC-DC that can drive up to 2-A load with exceptional power conversion efficiency, line and load regulation, and output accuracy. The LMZ14202 is available in an innovative package that enhances thermal performance and allows for hand or machine soldering.

The LMZ14202 can accept an input voltage rail between 6 V and 42 V and deliver an adjustable and highly accurate output voltage as low as 0.8 V. The LMZ14202 only requires three external resistors and four external capacitors to complete the power solution. The LMZ14202 is a reliable and robust design with the following protection features: thermal shutdown, input undervoltage lockout, output overvoltage protection, short-circuit protection, output current limit, and allows start-up into a prebiased output. A single resistor adjusts the switching frequency up to 1 MHz.

Device Information⁽¹⁾⁽²⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMZ14202	TO-PMOD (7)	10.16 mm × 9.85 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

(2) Peak reflow temperature equals 245°C . See [SNAA214](#) for more details.

• Changed the title of the document	1
Changes from Revision G (March 2013) to Revision H	Page
• Added <i>Pin Configuration and Functions</i> section, <i>Handling Rating</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1
• Removed Easy-To-Use 7-Pin Package PFM 7-Pin Package image.....	1
Changes from Revision F (October 2012) to Revision G	Page
• Changed layout of National Data Sheet to TI format	23
• Added <i>Power Module SMT Guidelines</i> section	23

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
EN	3	Analog	Enable. Input to the precision enable comparator. Rising threshold is 1.18 V nominal, 90 mV hysteresis nominal. Maximum recommended input level is 6.5 V.
FB	6	Analog	Feedback. Internally connected to the regulation, overvoltage, and short-circuit comparators. The regulation reference point is 0.8 V at this input pin. Connected the feedback resistor divider between the output and ground to set the output voltage.
GND	4	Ground	Ground. Reference point for all stated voltages. Must be externally connected to thermal pad.
RON	2	Analog	ON-time resistor. An external resistor between this pin and the VIN pin sets the ON-time of the application. Typical values range from 25 kΩ to 124 kΩ.
SS	5	Analog	Soft-start. An internal 8-μA current source charges an external capacitor to produce the soft-start function. This node is discharged at 200 μA during disable, over-current, thermal shutdown and internal UVLO conditions.
VIN	1	Power	Supply input. Nominal operating range is 6 V to 42 V. A small amount of internal capacitance is contained within the package assembly. Additional external input capacitance is required between this pin and exposed pad.
VOUT	7	Power	Output voltage. Output from the internal inductor. Connect the output capacitor between this pin and exposed pad.
Thermal pad		Ground	Exposed Pad — Internally connected to pin 4. Used to dissipate heat from the package during operation. Must be electrically connected to pin 4 external to the package.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
VIN, RON to GND	−0.3	43.5	V
EN, FB, SS to GND	−0.3	7	V
T _J Junction temperature		150	°C
Peak reflow case temperature (30 s)		245	°C
T _{stg} Storage temperature	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) For soldering specifications, refer to the following document: www.ti.com/lit/snoa549c

6.2 ESD Ratings

	VALUE	UNIT
V _(ESD) Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000 V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

6.5 Electrical Characteristics

Limits in standard type are for T_J = 25°C only; limits in boldface type apply over the junction temperature (T_J) range of –40°C to +125°C. Minimum and maximum limits are ensured through test, design or statistical correlation. Typical values represent the most likely parametric norm at T_J = 25°C, and are provided for reference purposes only. Unless otherwise stated the following conditions apply: V_{VIN} = 24 V, V_{VOUT} = 3.3 V

PARAMETER		TEST CONDITIONS		MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
ENABLE CONTROL ⁽³⁾							
V _{EN}	EN threshold trip point	V _{EN} rising		1.18		V	
			−40°C ≤ T _J ≤ 125°C	1.1	1.25		
V _{EN-HYS}	EN threshold hysteresis	V _{EN} falling		90		mV	
SOFT-START							
I _{SS}	SS source current	V _{SS} = 0 V		8		μA	
			−40°C ≤ T _J ≤ 125°C	5	11		
I _{SS-DIS}	SS discharge current			-200		μA	
CURRENT LIMIT							
I _{CL}	Current limit threshold	d.c. average		2.6		A	
			−40°C ≤ T _J ≤ 125°C	2.3	3.65		
ON/OFF TIMER							
t _{ON-MIN}	ON timer minimum pulse width			150		ns	
t _{OFF}	OFF timer pulse width			260		ns	
REGULATION AND OVERVOLTAGE COMPARATOR							
V _{FB}	In-regulation feedback voltage	V _{SS} > 0.8 V, I _O = 2 A		0.795		V	
			−40°C ≤ T _J ≤ 125°C	0.775	0.815		
			V _{SS} >+ 0.8 V, I _O = 10 mA	0.786	0.802	0.818	V
V _{FB-OV}	Feedback over-voltage protection threshold			0.92		V	
I _{FB}	Feedback input bias current			5		nA	

- (1) Minimum and maximum limits are 100% production tested at 25°C. Limits over the operating temperature range are ensured through correlation using Statistical Quality Control (SQC) methods. Limits are used to calculate Average Outgoing Quality Level (AOQL).
- (2) Typical numbers are at 25°C and represent the most likely parametric norm.
- (3) EN 55022:2006, +A1:2007, FCC Part 15 Subpart B: 2007. See AN-2024 LMZ1420x / LMZ1200x Evaluation Board ([SNVA422](#)) and layout for information on device under test.

Electrical Characteristics (continued)

Limits in standard type are for $T_J = 25^{\circ}\text{C}$ only; limits in boldface type apply over the junction temperature (T_J) range of -40°C to $+125^{\circ}\text{C}$. Minimum and maximum limits are ensured through test, design or statistical correlation. Typical values represent the most likely parametric norm at $T_J = 25^{\circ}\text{C}$, and are provided for reference purposes only. Unless otherwise stated the following conditions apply: $V_{\text{VIN}} = 24\text{ V}$, $V_{\text{VOUT}} = 3.3\text{ V}$

PARAMETER	TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
I_Q Non-switching input current	$V_{\text{FB}} = 0.86\text{ V}$		1		mA
I_{SD} Shutdown quiescent current	$V_{\text{EN}} = 0\text{ V}$		25		μA
THERMAL CHARACTERISTICS					
T_{SD} Thermal shutdown	Rising		165		$^{\circ}\text{C}$
$T_{\text{SD-HYST}}$ Thermal shutdown hysteresis	Falling		15		$^{\circ}\text{C}$
PERFORMANCE PARAMETERS					
ΔV_O Output voltage ripple			8		mV _{p-p}
$\Delta V_O/\Delta V_{\text{IN}}$ Line regulation	$12\text{ V} \leq V_{\text{VIN}} \leq 42\text{ V}$, $I_O = 2\text{ A}$		0.01%		
$\Delta V_O/I_{\text{OUT}}$ Load regulation	$V_{\text{VIN}} = 24\text{ V}$		1.5		mV/A
η Efficiency	$V_{\text{VIN}} = 24\text{ V}$, $V_O = 3.3\text{ V}$, $I_O = 1\text{ A}$		86%		
	$V_{\text{VIN}} = 24\text{ V}$, $V_O = 3.3\text{ V}$, $I_O = 2\text{ A}$		85%		

6.6 Typical Characteristics

7 Detailed Description

7.1 Overview

The LMZ14202 is a step-down DC-to-DC power module. It is typically used to convert a higher DC voltage to a lower DC voltage with a maximum output current of 2 A.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Constant On-Time Control (COT) Circuit Overview

Constant on-time control (COT) control is based on a comparator and an ON-time one-shot, with the output voltage feedback compared with an internal 0.8-V reference. If the feedback voltage is below the reference, the main MOSFET is turned on for a fixed ON-time determined by a programming resistor $R_{DS(on)}$. $R_{DS(on)}$ is connected to V_{IN} such that ON-time is reduced with increasing input supply voltage. Following this ON-time, the main MOSFET remains off for a minimum of 260 ns. If the voltage on the feedback pin falls below the reference level again the ON-time cycle is repeated. Regulation is achieved in this manner.

7.3.2 Output Overvoltage Comparator

The voltage at FB is compared to a 0.92-V internal reference. If FB rises above 0.92 V the ON-time is immediately terminated. This condition is known as over-voltage protection (OVP). It can occur if the input voltage is increased very suddenly or if the output load is decreased very suddenly. Once OVP is activated, the top MOSFET ON-times are inhibited until the condition clears. Additionally, the synchronous MOSFET remains on until the inductor current falls to zero.

Feature Description (continued)

7.3.3 Current Limit

Current limit detection is carried out during the OFF-time by monitoring the current in the synchronous MOSFET. Referring to the [Functional Block Diagram](#), when the top MOSFET is turned off, the inductor current flows through the load, the PGND pin and the internal synchronous MOSFET. If this current exceeds 2.6 A (typical) the current limit comparator disables the start of the next ON-time period. The next switching cycle occurs only if the FB input is less than 0.8 V and the inductor current has decreased below 2.6 A. Inductor current is monitored during the period of time the synchronous MOSFET is conducting. While the inductor current exceeds 2.6 A, further ON-time intervals for the top MOSFET do not occur. Switching frequency is lower during current limit due to the longer OFF-time.

NOTE

Current limit is dependent on both duty cycle and temperature as illustrated in the graphs in [Typical Characteristics](#) section.

7.3.4 Thermal Protection

Do not allow the junction temperature of the LMZ14202 device to exceed its maximum ratings. Thermal protection is implemented by an internal thermal shutdown circuit which activates at 165 °C (typical) causing the device to enter a low power standby state. In this state the main MOSFET remains off causing V_O to fall, and additionally the CSS capacitor is discharged to ground. Thermal protection helps prevent catastrophic failures for accidental device overheating. When the junction temperature returns to below 145 °C (typical hysteresis = 20 °C) the SS pin is released, V_O rises smoothly, and normal operation resumes.

Applications requiring maximum output current especially those at high input voltage may require application derating at elevated temperatures.

7.3.5 Zero Coil Current Detection

The current of the lower (synchronous) MOSFET is monitored by a zero coil current detection circuit which inhibits the synchronous MOSFET when its current reaches zero until the next ON-time. This circuit enables the DCM operating mode, which improves efficiency at light loads.

7.3.6 Prebiased Start-Up

The LMZ14202 starts up into a pre-biased output. This startup situation is common in multiple rail logic applications where current paths may exist between different power rails during the startup sequence. [Figure 31](#) is a scope capture that shows proper behavior during this event.

Figure 31. Prebiased Start-Up

7.4 Device Functional Modes

7.4.1 Discontinuous Conduction and Continuous Conduction Modes

At light-load, the regulator operates in discontinuous conduction mode (DCM). With load currents above the critical conduction point, it operates in continuous conduction mode (CCM). When operating in DCM the switching cycle begins at zero amps inductor current; increases up to a peak value, and then recedes back to zero before the end of the OFF-time. During the period of time that inductor current is zero, all load current is supplied by the output capacitor. The next ON-time period starts when the voltage on the FB pin falls below the internal reference. The switching frequency is lower in DCM and varies more with load current as compared to CCM. Conversion efficiency in DCM is maintained because conduction and switching losses are reduced with the smaller load and lower switching frequency.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Validate and test the design implementation to confirm system functionality.

8.1 Application Information

The LMZ14202 is a step-down DC-to-DC power module. It is typically used to convert a higher DC voltage to a lower DC voltage with a maximum output current of 2 A. The following design procedure can be used to select components for the LMZ14202. Alternately, the WEBENCH software may be used to generate complete designs.

WEBENCH software uses an iterative design procedure and accesses comprehensive databases of components. For more details, go to www.ti.com/WEBENCH.

8.2 Typical Application

Figure 32. Evaluation Board Schematic Diagram

8.2.1 Design Requirements

For this example the following application parameters exist.

- V_{IN} range: up to 42 V
- $V_{OUT} = 0.8$ V to 5 V
- $I_{OUT} = 2$ A

Refer to [Table 2](#) for more information.

Table 1. Component Value Combinations

8.2.2 Detailed Design Procedure

8.2.2.1 Design Steps for the LMZ14202 Application

The LMZ14202 is fully supported by WEBENCH and offers the following: Component selection, electrical and thermal simulations as well as the build-it board for a reduction in design time. The following list of steps can be used to manually design the LMZ14202 application.

1. Select minimum operating V_{IN} with enable divider resistors
2. Program V_O with divider resistor selection
3. Program turnon time with soft-start capacitor selection
4. Select C_O
5. Select C_{IN}
6. Set operating frequency with R_{DS(on)}
7. Determine module dissipation
8. Carefully consider thermal performance required when designing the PCB layout

8.2.2.1.1 Enable Divider, R_{ENT} and R_{ENB} Selection

The enable input provides a precise, 1.18-V band-gap rising threshold to allow direct logic drive or connection to a voltage divider from a higher enable voltage such as V_{IN}. The enable input also incorporates 90 mV (typical) of hysteresis resulting in a falling threshold of 1.09 V. The maximum recommended voltage into the EN pin is 6.5 V. For applications where the midpoint of the enable divider exceeds 6.5 V, a small Zener diode can be added to limit this voltage.

The function of this resistive divider is to allow the designer to choose an input voltage below which the circuit becomes disabled. This implements the feature of programmable undervoltage lockout. This is often used in battery powered systems to prevent deep discharge of the system battery. It is also useful in system designs for sequencing of output rails or to prevent early turnon of the supply as the main input voltage rail rises at power-up. Applying the enable divider to the main input rail is often done in the case of higher input voltage systems such as 24-V AC/DC systems where a lower boundary of operation must be established. In the case of sequencing supplies, the divider is connected to a rail that becomes active earlier in the power-up cycle than the LMZ14202 output rail. Choose the two resistors based on [Equation 1](#).

$$R_{ENT} / R_{ENB} = (V_{IN\ UVLO} / 1.18\ V) - 1 \quad (1)$$

The LMZ14202 demonstration and evaluation boards use 11.8 kΩ for R_{ENB} and 68.1 kΩ for R_{ENT} resulting in a rising UVLO of 8 V. This divider presents 6.25 V to the EN input when the divider input is raised to 42 V.

The EN pin is internally pulled up to VIN and can be left floating for always-on operation.

8.2.2.1.2 Output Voltage Selection

Output voltage is determined by a divider of two resistors connected between V_O and ground. The midpoint of the divider is connected to the FB input. The voltage at FB is compared to a 0.8-V internal reference. In normal operation an ON-time cycle is initiated when the voltage on the FB pin falls below 0.8 V. The main MOSFET ON-time cycle causes the output voltage to rise and the voltage at the FB to exceed 0.8 V. As long as the voltage at FB is above 0.8 V, ON-time cycles does not occur.

The regulated output voltage determined by the external divider resistors R_{FBT} and R_{FBB} is:

$$V_O = 0.8\ V \times (1 + R_{FBT} / R_{FBB}) \quad (2)$$

Rearranging terms; the ratio of the feedback resistors for a desired output voltage is:

$$R_{FBT} / R_{FBB} = (V_O / 0.8\ V) - 1 \quad (3)$$

Choose these resistors from values between 1 kΩ and 10 kΩ.

For $V_O = 0.8\ V$ the FB pin can be connected to the output directly so long as an output preload resistor remains that draws more than 20 μA. Converter operation requires this minimum load to create a small inductor ripple current and maintain proper regulation when no load is present.

A feed-forward capacitor is placed in parallel with R_{FBT} to improve load step transient response. Its value is usually determined experimentally by load stepping between DCM and CCM conduction modes and adjusting for best transient response and minimum output ripple.

A table of values for R_{FBT} , R_{FBB} , C_{FF} and $R_{DS(on)}$ is included in the applications schematic.

8.2.2.1.3 Soft-Start Capacitor Selection

Programmable soft-start permits the regulator to slowly ramp to its steady state operating point after being enabled, thereby reducing current inrush from the input supply and slowing the output voltage rise-time to prevent overshoot.

Upon turnon, after all UVLO conditions have been passed, an internal 8 μA current source begins charging the external soft-start capacitor. The soft-start time duration to reach steady state operation is given by the formula:

$$t_{SS} = V_{REF} \times C_{SS} / I_{SS} = 0.8\ V \times C_{SS} / 8\ \mu A \quad (4)$$

This equation can be rearranged as follows:

$$C_{SS} = t_{SS} \times 8\ \mu A / 0.8\ V \quad (5)$$

Use of a 0.022-μF capacitor results in 2.2-ms soft-start duration which is recommended as a minimum value.

As the soft-start input exceeds 0.8 V the output of the power stage comes into regulation. The soft-start capacitor continues charging until it reaches approximately 3.8 V on the SS pin. Voltage levels between 0.8 V and 3.8 V have no effect on other circuit operation. The following conditions reset the soft-start capacitor by discharging the SS input to ground with an internal 200-μA current sink.

- The enable input being pulled low
- Thermal shutdown condition
- Over-current fault
- Internal V_{CC} UVLO (approximately 4-V input to V_{IN})

8.2.2.1.4 C_O Selection

None of the required C_O output capacitance is contained within the module. At a minimum, the output capacitor must meet the worst-case minimum ripple current rating of $0.5 \times I_{LR(P-P)}$, as calculated in Equation 17 below. Beyond the worst-case minimum, additional capacitance reduces output ripple as long as the ESR is low enough to permit it. A minimum value of 10 μ F is generally required. Expect to experiment when designing an application to operate with a minimum value. Ceramic capacitors or other low ESR types are recommended. See AN-2024 LMZ1420x / LMZ1200x Evaluation Board (SNVA422) for more detail.

Equation 6 provides a good first-pass approximation of C_O for load transient requirements:

$$C_O \geq I_{STEP} \times V_{FB} \times L \times V_{IN} / (4 \times V_O \times (V_{IN} - V_O) \times V_{OUT-TRAN}) \quad (6)$$

Solving:

$$C_O \geq 2 \text{ A} \times 0.8 \text{ V} \times 10 \mu\text{F} \times 24 \text{ V} / (4 \times 3.3 \text{ V} \times (24 \text{ V} - 3.3 \text{ V}) \times 33 \text{ mV}) \geq 43 \mu\text{F} \quad (7)$$

The LMZ14202 demonstration and evaluation boards are populated with a 100- μ F 6.3-V X5R output capacitor. Locations for extra output capacitors are provided. See AN-2024 LMZ1420x / LMZ1200x Evaluation Board (SNVA422) for locations.

8.2.2.1.5 Input Capacitance (C_{IN}) Selection

The LMZ14202 module contains an internal 0.47- μ F input ceramic capacitor. Additional input capacitance is required external to the module to handle the input ripple current of the application. This input capacitance must be very close to the module. Input capacitor selection is generally directed to satisfy the input ripple current requirements rather than by capacitance value. Worst-case input ripple current rating is dictated by Equation 8:

$$I_{CIN(rms)} \cong \frac{1}{2} \times I_O \times \sqrt{\frac{D}{1-D}}$$

where

$$\bullet \quad D \cong V_O / V_{IN} \quad (8)$$

The worst-case ripple current occurs when the module is presented with full load current and when $V_{IN} = (2 \times V_O)$.

Recommended minimum input capacitance is 10- μ F X7R ceramic with a voltage rating at least 25% higher than the maximum applied input voltage for the application. TI also recommends to pay attention to the voltage and temperature deratings of the capacitor selected.

NOTE

If the capacitor data sheet omits ripple current rating of the ceramic capacitors, contact the capacitor manufacturer to obtain this rating.

If the system design requires a certain minimum value of input ripple voltage ΔV_{IN} be maintained then Equation 9 may be used.

$$C_{IN} \geq I_O \times D \times (1-D) / f_{SW-CCM} \times \Delta V_{IN} \quad (9)$$

If ΔV_{IN} is 1% of V_{IN} for a 24V input to 3.3V output application this equals 240 mV and $f_{SW} = 400 \text{ kHz}$.

$$C_{IN} \geq 2 \text{ A} \times 3.3 \text{ V} / 24 \text{ V} \times (1 - 3.3 \text{ V} / 24 \text{ V}) / (400000 \times 0.240 \text{ V})$$

$$\geq 2.5 \mu\text{F}$$

Additional bulk capacitance with higher ESR may be required to damp any resonant effects of the input capacitance and parasitic inductance of the incoming supply lines.

8.2.2.1.6 R_{DS(on)} Resistor Selection

Many designs begin with a desired switching frequency in mind. For that purpose Equation 10 can be used.

$$f_{SW(CCM)} \cong V_O / (1.3 \times 10^{-10} \times R_{DS(on)}) \quad (10)$$

This can be rearranged as

$$R_{DS(on)} \cong V_O / (1.3 \times 10^{-10} \times f_{SW(CCM)}) \quad (11)$$

The selection of R_{ON} and $f_{SW(CCM)}$ must be confined by limitations in the ON-time and OFF-time for the [Constant On-Time Control \(COT\) Circuit Overview](#) section.

The ON-time of the LMZ14202 timer is determined by the resistor $R_{DS(on)}$ and the input voltage V_{IN} . It is calculated as follows:

$$t_{ON} = (1.3 \times 10^{-10} \times R_{DS(on)}) / V_{IN} \quad (12)$$

The inverse relationship of t_{ON} and V_{IN} gives a nearly constant switching frequency as V_{IN} is varied. Select an $R_{DS(on)}$ level to facilitate an ON-time at maximum V_{IN} is greater than 150 ns. The ON-timer has a limiter to ensure a minimum of 150 ns for t_{ON} . This function limits the maximum operating frequency, which is governed by [Equation 13](#):

$$f_{SW(max)} = V_O / (V_{IN(max)} \times 150 \text{ ns}) \quad (13)$$

Use [Equation 14](#) to select $R_{DS(on)}$ a particular operating frequency while maintaining the minimum ON-time of 150 ns.

$$R_{DS(on)} \geq V_{IN(max)} \times 150 \text{ ns} / (1.3 \times 10^{-10}) \quad (14)$$

If $R_{DS(on)}$ calculated in [Equation 11](#) is less than the minimum value determined in [Equation 14](#), select a lower frequency. Alternatively, $V_{IN(max)}$ can also be limited to keep the frequency unchanged.

NOTE

The minimum OFF-time of 260 ns limits the maximum duty ratio. Select a larger $R_{DS(on)}$ (lower f_{SW}) for any application requiring large duty ratio.

8.2.2.1.6.1 Discontinuous Conduction and Continuous Conduction Mode Selection

Operating frequency in DCM can be calculated as follows:

$$f_{SW(DCM)} \approx V_O \times (V_{IN} - 1) \times 10 \mu\text{H} \times 1.18 \times 10^{20} \times I_O / (V_{IN} - V_O) \times R_{DS(on)}^2 \quad (15)$$

In CCM, current flows through the inductor through the entire switching cycle and never falls to zero during the OFF-time. The switching frequency remains relatively constant with load current and line voltage variations. The CCM operating frequency can be calculated using [Equation 7](#) above.

Following is a comparison pair of waveforms of the showing both CCM (upper) and DCM operating modes.

Figure 33. CCM and DCM Operating Modes
 $V_{IN} = 24 \text{ V}$, $V_O = 3.3 \text{ V}$, $I_O = 2 \text{ A}$ /0.32 A 2 μs/div

The approximate formula for determining the DCM/CCM boundary is as follows:

$$I_{DCB} \approx V_O \times (V_{IN} - V_O) / (2 \times 10 \mu\text{H} \times f_{SW(CCM)} \times V_{IN}) \quad (16)$$

Following is a typical waveform showing the boundary condition.

Figure 34. Transition Mode Operation
 $V_{IN} = 24\text{ V}$, $V_O = 3.3\text{ V}$, $I_O = 0.35\text{ A}$ 2 $\mu\text{sec/div}$

The inductor internal to the module is 10 μH . This value was chosen as a good balance between low and high input voltage applications. The main parameter affected by the inductor is the amplitude of the inductor ripple current (I_{LR}). I_{LR} can be calculated with:

$$I_{LR\text{ P-P}} = V_O \times (V_{IN} - V_O) / (10\text{ }\mu\text{H} \times f_{SW} \times V_{IN})$$

where

- V_{IN} is the maximum input voltage and f_{SW} is determined from [Equation 10](#). (17)

If the output current I_O is determined by assuming that $I_O = I_L$, the higher and lower peak of I_{LR} can be determined. Be aware that the lower peak of I_{LR} must be positive if CCM operation is required.

9 Power Supply Recommendations

The LMZ14202 device is designed to operate from an input voltage supply range between 4.5 V and 42 V. Use a well-regulated input supply that can withstand maximum input current and maintain a stable voltage. The resistance of the input supply rail must be low enough that an input current transient does not cause a high enough drop at the LMZ14202 supply voltage that can cause a false UVLO fault triggering and system reset. If the input supply is more than a few inches from the LMZ14202, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. The amount of bulk capacitance is not critical, but a 47- μ F or 100- μ F electrolytic capacitor is a typical choice.

10 Layout

10.1 Layout Guidelines

PCB layout is an important part of DC-DC converter design. Poor board layout can disrupt the performance of a DC-DC converter and surrounding circuitry by contributing to EMI, ground bounce and resistive voltage drop in the traces. These can send erroneous signals to the DC-DC converter resulting in poor regulation or instability. Good layout can be implemented by following a few simple design rules.

- **Minimize area of switched current loops.** When considering EMI reduction, it is imperative to minimize the high di/dt paths during PCB layout. The high-current loops that do not overlap have high di/dt content that cause observable high frequency noise on the output pin if the input capacitor (C_{IN1}) is placed at a distance away from the LMZ14202. Therefore place C_{IN1} as close as possible to the LMZ14202 VIN and GND exposed thermal pad. This placement minimizes the high di/dt area and reduce radiated EMI. Additionally, ensure that grounding for both the input and output capacitor consists of a localized top side plane that connects to the GND exposed thermal pad (EP).
- **Have a single point ground.** Route the ground connections for the feedback, soft-start, and enable components to the GND pin of the device. This routing prevents any switched or load currents from flowing in the analog ground traces. If not properly handled, poor grounding can result in degraded load regulation or erratic output voltage ripple behavior. Provide the single point ground connection from pin 4 to the exposed thermal pad.
- **Minimize trace length to the FB pin.** Place both feedback resistors, R_{FBT} and R_{FBB} , and the feed forward capacitor C_{FF} , close to the FB pin. Because the FB node is high impedance, maintain the copper area as small as possible. To minimize noise, route the traces from R_{FBT} , R_{FBB} , and C_{FF} away from the body of the LMZ14202 device.
- **Make input and output bus connections as wide as possible.** Width reduces any voltage drops on the input or output of the converter and maximizes efficiency. To optimize voltage accuracy at the load, ensure that a separate feedback voltage sense trace is made to the load to correct for voltage drops and provide optimum output accuracy.
- **Provide adequate device heat-sinking.** Use an array of heat-sinking vias to connect the exposed pad to the ground plane on the bottom PCB layer. If the PCB has a plurality of copper layers, these thermal vias can also be employed to make connection to inner layer heat-spreading ground planes. For best results use a 6 × 6 via array with minimum via diameter of 10 mils (254 μ m) thermal vias spaced 59 mils (1.5 mm). Ensure enough copper area is used for heat-sinking to maintain the junction temperature below 125°C.

Layout Example (continued)

Figure 41. EVM Board Layout - Bottom View

10.3 Power Dissipation and Board Thermal Requirements

When $V_{IN} = 24\text{ V}$, $V_O = 3.3\text{ V}$, $I_O = 2\text{ A}$, $T_{A(max)} = 85^\circ\text{C}$, and $T_J = 125^\circ\text{C}$, the device must achieve a thermal resistance from case-to-ambient described by [Equation 18](#).

$$R_{\theta CA} < (T_{J(max)} - T_{A(max)}) / P_{IC-LOSS} - R_{\theta JC} \quad (18)$$

Given the typical thermal resistance from junction to case to be 1.9°C/W , use the 85°C power dissipation curves in [Typical Characteristics](#) to estimate the $P_{IC-LOSS}$ for the application. In this application it is 1.5 W .

$$R_{\theta CA} = (125 - 85) / (1.5\text{ W} - 1.9) = 24.8 \quad (19)$$

To reach $R_{\theta CA} = 24.8$, the PCB is required to dissipate heat effectively. With no airflow and no external heat, use [Equation 20](#) to estimate the required board area covered by 1 oz. copper on both the top and bottom metal layers.

$$\text{Board Area}_{\text{cm}^2} = 500^\circ\text{C} \times \text{cm}^2/\text{W} / R_{\theta JC} \quad (20)$$

As a result, approximately 20.2 square cm of 1 oz copper on top and bottom layers is required for the PCB design. The PCB copper heat sink must be connected to the exposed pad. Approximately thirty-six, 10 mils ($254\text{ }\mu\text{m}$) thermal vias spaced 59 mils (1.5 mm) apart must connect the top copper to the bottom copper. For an example of a high thermal performance PCB layout, refer to the *AN-2024 LMZ1420x / LMZ1200x Evaluation Board* ([SNVA422](#)).

10.4 Power Module SMT Guidelines

The recommendations below are for a standard module surface mount assembly

- **Land Pattern** Follow the PCB land pattern with either soldermask defined or non-soldermask defined pads
- **Stencil Aperture**
 - For the exposed die attach pad (DAP), adjust the stencil for approximately 80% coverage of the PCB land pattern
 - For all other I/O pads use a 1:1 ratio between the aperture and the land pattern recommendation
- **Solder Paste** Use a standard SAC Alloy such as SAC 305, type 3 or higher
- **Stencil Thickness:** 0.125 to 0.15 mm
- **Reflow:** Refer to solder paste supplier recommendation and optimized per board size and density
 - Refer to AN [SNAA214](#) for reflow information
 - Maximum number of reflows allowed is one

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
