

CY8C22113 and CY8C22213

Features

■ Powerful Harvard Architecture Processor

- M8C Processor Speeds to 24 MHz
- Low Power at High Speed
- 3.0 to 5.25 V Operating Voltage
- Industrial Temperature Range: -40°C to +85°C

■ Advanced Peripherals (PSoC Blocks)

- 3 Rail-to-Rail Analog PSoC Blocks Provide:
 - Up to 14-Bit ADCs
 - Up to 9-Bit DACs
 - Programmable Gain Amplifiers
 - Programmable Filters and Comparators
- 4 Digital PSoC Blocks Provide:
 - 8- to 32-Bit Timers, Counters, and PWMs
 - CRC and PRS Modules
 - Full-Duplex UART
 - SPI™ Masters or Slaves
 - Connectable to all GPIO Pins
- Complex Peripherals by Combining Blocks

■ Precision, Programmable Clocking

- Internal $\pm 2.5\%$ 24/48 MHz Oscillator
- High-Accuracy 24 MHz with Optional 32.768 kHz Crystal and PLL
- Optional External Oscillator, up to 24 MHz
- Internal Oscillator for Watchdog and Sleep

■ Flexible On-Chip Memory

- 2K Bytes Flash Program Storage 50,000 Erase/Write Cycles
- 256 Bytes SRAM Data Storage
- In-System Serial Programming (ISSP™)
- Partial Flash Updates
- Flexible Protection Modes
- EEPROM Emulation in Flash

■ Programmable Pin Configurations

- 25 mA Sink on all GPIO
- Pull up, Pull down, High Z, Strong, or Open Drain Drive Modes on all GPIO
- Up to 8 Analog Inputs on GPIO
- One 30 mA Analog Outputs on GPIO
- Configurable Interrupt on all GPIO

■ Additional System Resources

- I²C™ Slave, Master, and Multi-Master to 400 kHz
- Watchdog and Sleep Timers
- User-Configurable Low Voltage Detection
- Integrated Supervisory Circuit
- On-Chip Precision Voltage Reference

■ Complete Development Tools

- Free Development Software (PSoC™ Designer)
- Full-Featured, In-Circuit Emulator and Programmer
- Full Speed Emulation
- Complex Breakpoint Structure
- 128K Bytes Trace Memory

PSoC™ Functional Overview

The PSoC™ family consists of many *Mixed Signal Array with On-Chip Controller* devices. These devices are designed to replace multiple traditional MCU-based system components with one, low cost single-chip programmable device. PSoC devices include configurable blocks of analog and digital logic, as well as programmable interconnects. This architecture allows the user to create customized peripheral configurations that match the requirements of each individual application. Additionally, a fast CPU, Flash program memory, SRAM data memory, and configurable IO are included in a range of convenient pinouts and packages.

The PSoC architecture, as illustrated on the left, is comprised of four main areas: PSoC Core, Digital System, Analog System, and System Resources. Configurable global busing allows all the device resources to be combined into a complete custom system. The PSoC CY8C22x13 family can have up to two IO ports that connect to the global digital and analog interconnects, providing access to 4 digital blocks and 3 analog blocks.

The PSoC Core

The PSoC Core is a powerful engine that supports a rich feature set. The core includes a CPU, memory, clocks, and configurable GPIO (General Purpose IO).

The M8C CPU core is a powerful processor with speeds up to 24 MHz, providing a four MIPS 8-bit Harvard architecture micro-

processor. The CPU utilizes an interrupt controller with 10 vectors, to simplify programming of real time embedded events. Program execution is timed and protected using the included Sleep and Watch Dog Timers (WDT).

Memory encompasses 2 KB of Flash for program storage, 256 bytes of SRAM for data storage, and up to 2 KB of EEPROM emulated using the Flash. Program Flash utilizes four protection levels on blocks of 64 bytes, allowing customized software IP protection.

The PSoC device incorporates flexible internal clock generators, including a 24 MHz IMO (internal main oscillator) accurate to 2.5% over temperature and voltage. The 24 MHz IMO can also be doubled to 48 MHz for use by the digital system. A low power 32 kHz ILO (internal low speed oscillator) is provided for the Sleep timer and WDT. If crystal accuracy is desired, the ECO (32.768 kHz external crystal oscillator) is available for use as a Real Time Clock (RTC) and can optionally generate a crystal-accurate 24 MHz system clock using a PLL. The clocks, together with programmable clock dividers (as a System Resource), provide the flexibility to integrate almost any timing requirement into the PSoC device.

PSoC GPIOs provide connection to the CPU, digital and analog resources of the device. Each pin's drive mode may be selected from eight options, allowing great flexibility in external interfacing. Every pin also has the capability to generate a system interrupt on high level, low level, and change from last read.

The Digital System

The Digital System is composed of 4 digital PSoC blocks. Each block is an 8-bit resource that can be used alone or combined with other blocks to form 8, 16, 24, and 32-bit peripherals, which are called user module references.

Digital System Block Diagram

Digital peripheral configurations include those listed below.

- PWMs (8 to 32 bit)
- PWMs with Dead band (8 to 32 bit)
- Counters (8 to 32 bit)
- Timers (8 to 32 bit)
- UART 8-bit with selectable parity (up to 1)
- SPI master and slave (up to 1)
- I2C slave and master (1 available as a System Resource)
- Cyclical Redundancy Checker/Generator (8 to 32 bit)
- IrDA (up to 1)
- Pseudo Random Sequence Generators (8 to 32 bit)

The digital blocks can be connected to any GPIO through a series of global buses that can route any signal to any pin. The buses also allow for signal multiplexing and for performing logic operations. This configurability frees your designs from the constraints of a fixed peripheral controller.

Digital blocks are provided in rows of four, where the number of blocks varies by PSoC device family. This allows you the optimum choice of system resources for your application. Family resources are shown in the table titled “[PSoC Device Characteristics](#)” on page 3.

The Analog System

The Analog System is composed of 3 configurable blocks, each comprised of an opamp circuit allowing the creation of complex analog signal flows. Analog peripherals are very flexible and can be customized to support specific application requirements. Some of the more common PSoC analog functions (most available as user modules) are listed below.

- Analog-to-digital converters (one with 6- to 14-bit resolution, selectable as Incremental, Delta Sigma, and SAR)
- Filters (two pole band-pass, low-pass, and notch)
- Amplifiers (one with selectable gain to 48x)
- Comparators (one with 16 selectable thresholds)
- DACs (one with 6- to 9-bit resolution)
- Multiplying DACs (one with 6- to 9-bit resolution)
- High current output drivers (one with 30 mA drive as a Core Resource)
- 1.3V reference (as a System Resource)
- Many other topologies possible

Analog blocks are provided in columns of three, which includes one CT (Continuous Time) and two SC (Switched Capacitor) blocks. The number of blocks is dependant on the device family which is detailed in the table titled “PSoC Device Characteristics” on page 3.

Additional System Resources

System Resources, some of which have been previously listed, provide additional capability useful to complete systems. Additional resources include a decimator, low voltage detection, and power on reset. Brief statements describing the merits of each system resource are presented below.

- Digital clock dividers provide three customizable clock frequencies for use in applications. The clocks can be routed to both the digital and analog systems. Additional clocks can be generated using digital PSoC blocks as clock dividers.
- The decimator provides a custom hardware filter for digital signal processing applications including the creation of Delta Sigma ADCs.
- The I2C module provides 100 and 400 kHz communication over two wires. Slave, master, and multi-master modes are all supported.
- Low Voltage Detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced POR (Power On Reset) circuit eliminates the need for a system supervisor.
- An internal 1.3 voltage reference provides an absolute reference for the analog system, including ADCs and DACs.

PSoC Device Characteristics

Depending on your PSoC device characteristics, the digital and analog systems can have 16, 8, or 4 digital blocks and 12, 6, or 3 analog blocks. The following table lists the resources available for specific PSoC device groups.

PSoC Device Characteristics

Getting Started

The quickest path to understanding the PSoC silicon is by reading this data sheet and using the PSoC Designer Integrated Development Environment (IDE). This data sheet is an overview of the PSoC integrated circuit and presents specific pin, register, and electrical specifications. For in-depth information, along with detailed programming information, reference the *PSoC™ Mixed Signal Array Technical Reference Manual*.

For up-to-date Ordering, Packaging, and Electrical Specification information, reference the latest PSoC device data sheets on the web at <http://www.cypress.com/psoc>.

Development Kits

Development Kits are available from the following distributors: Digi-Key, Avnet, Arrow, and Future. The Cypress Online Store at <http://www.onfulfillment.com/cypresstore/> contains development kits, C compilers, and all accessories for PSoC development. Click on *PSoC (Programmable System-on-Chip)* to view a current list of available items.

Tele-Training

Free PSoC "Tele-training" is available for beginners and taught by a live marketing or application engineer over the phone. Five training classes are available to accelerate the learning curve including introduction, designing, debugging, advanced design, advanced analog, as well as application-specific classes covering topics like PSoC and the LIN bus. For days and times of the tele-training, see <http://www.cypress.com/support/training.cfm>.

Consultants

Certified PSoC Consultants offer everything from technical assistance to completed PSoC designs. To contact or become a PSoC Consultant, go to the following Cypress support web site: <http://www.cypress.com/support/cypros.cfm>.

Technical Support

PSoC application engineers take pride in fast and accurate response. They can be reached with a 4-hour guaranteed response at <http://www.cypress.com/support/login.cfm>.

Application Notes

A long list of application notes will assist you in every aspect of your design effort. To locate the PSoC application notes, go to <http://www.cypress.com/design/results.cfm>.

Development Tools

The Cypress MicroSystems PSoC Designer is a Microsoft® Windows-based, integrated development environment for the Programmable System-on-Chip (PSoC) devices. The PSoC Designer IDE and application runs on Windows 98, Windows NT 4.0, Windows 2000, Windows Millennium (Me), or Windows XP. (Reference the PSoC Designer Functional Flow diagram below.)

PSoC Designer helps the customer to select an operating configuration for the PSoC, write application code that uses the PSoC, and debug the application. This system provides design database management by project, an integrated debugger with In-Circuit Emulator, in-system programming support, and the CYASM macro assembler for the CPUs.

PSoC Designer also supports a high-level C language compiler developed specifically for the devices in the family.

PSoC Designer Subsystems

PSoC Designer Software Subsystems

Device Editor

The Device Editor subsystem allows the user to select different onboard analog and digital components called user modules using the PSoC blocks. Examples of user modules are ADCs, DACs, Amplifiers, and Filters.

The device editor also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic configuration allows for changing configurations at run time.

PSoC Designer sets up power-on initialization tables for selected PSoC block configurations and creates source code for an application framework. The framework contains software to operate the selected components and, if the project uses more than one operating configuration, contains routines to switch between different sets of PSoC block configurations at run time. PSoC Designer can print out a configuration sheet for a given project configuration for use during application programming in conjunction with the Device Data Sheet. Once the framework is generated, the user can add application-specific code to flesh out the framework. It's also possible to change the selected components and regenerate the framework.

Design Browser

The Design Browser allows users to select and import preconfigured designs into the user's project. Users can easily browse a catalog of preconfigured designs to facilitate time-to-design. Examples provided in the tools include a 300-baud modem, LIN Bus master and slave, fan controller, and magnetic card reader.

Application Editor

In the Application Editor you can edit your C language and Assembly language source code. You can also assemble, compile, link, and build.

Assembler. The macro assembler allows the assembly code to be merged seamlessly with C code. The link libraries automatically use absolute addressing or can be compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compiler. A C language compiler is available that supports Cypress MicroSystems' PSoC family devices. Even if you have never worked in the C language before, the product quickly allows you to create complete C programs for the PSoC family devices.

The embedded, optimizing C compiler provides all the features of C tailored to the PSoC architecture. It comes complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

The PSoC Designer Debugger subsystem provides hardware in-circuit emulation, allowing the designer to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow the designer to read and program and read and write data memory, read and write IO registers, read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also allows the designer to create a trace buffer of registers and memory locations of interest.

Online Help System

The online help system displays online, context-sensitive help for the user. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer in getting started.

Hardware Tools

In-Circuit Emulator

A low cost, high functionality ICE (In-Circuit Emulator) is available for development support. This hardware has the capability to program single devices.

The emulator consists of a base unit that connects to the PC by way of the parallel or USB port. The base unit is universal and will operate with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full speed (24 MHz) operation.

PSoC Development Tool Kit

User Modules and the PSoC Development Process

The development process for the PSoC device differs from that of a traditional fixed function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and by lowering inventory costs. These configurable resources, called PSoC Blocks, have the ability to implement a wide variety of user-selectable functions. Each block has several registers that determine its function and connectivity to other blocks, multiplexers, buses, and to the IO pins. Iterative development cycles permit you to adapt the hardware as well as the software. This substantially lowers the risk of having to select a different part to meet the final design requirements.

To speed the development process, the PSoC Designer Integrated Development Environment (IDE) provides a library of pre-built, pre-tested hardware peripheral functions, called “User Modules.” User modules make selecting and implementing peripheral devices simple, and come in analog, digital, and mixed signal varieties. The standard User Module library contains over 50 common peripherals such as ADCs, DACs Timers, Counters, UARTs, and other not-so common peripherals such as DTMF Generators and Bi-Quad analog filter sections.

Each user module establishes the basic register settings that implement the selected function. It also provides parameters that allow you to tailor its precise configuration to your particular application. For example, a Pulse Width Modulator User Module configures one or more digital PSoC blocks, one for each 8 bits of resolution. The user module parameters permit you to establish the pulse width and duty cycle. User modules also provide tested software to cut your development time. The user module application programming interface (API) provides high-level functions to control and respond to hardware events at run-time. The API also provides optional interrupt service routines that you can adapt as needed.

The API functions are documented in user module data sheets that are viewed directly in the PSoC Designer IDE. These data sheets explain the internal operation of the user module and provide performance specifications. Each data sheet describes the use of each user module parameter and documents the setting of each register controlled by the user module.

The development process starts when you open a new project and bring up the Device Editor, a pictorial environment (GUI) for configuring the hardware. You pick the user modules you need for your project and map them onto the PSoC blocks with point-and-click simplicity. Next, you build signal chains by interconnecting user modules to each other and the IO pins. At this stage, you also configure the clock source connections and enter parameter values directly or by selecting values from drop-down menus. When you are ready to test the hardware configuration or move on to developing code for the project, you perform the “Generate Application” step. This causes PSoC Designer to generate source code that automatically configures

the device to your specification and provides the high-level user module API functions.

User Modules and Development Process Flow Chart

The next step is to write your main program, and any sub-routines using PSoC Designer's Application Editor subsystem. The Application Editor includes a Project Manager that allows you to open the project source code files (including all generated code files) from a hierarchal view. The source code editor provides syntax coloring and advanced edit features for both C and assembly language. File search capabilities include simple string searches and recursive “grep-style” patterns. A single mouse click invokes the Build Manager. It employs a professional-strength “makefile” system to automatically analyze all file dependencies and run the compiler and assembler as necessary. Project-level options control optimization strategies used by the compiler and linker. Syntax errors are displayed in a console window. Double clicking the error message takes you directly to the offending line of source code. When all is correct, the linker builds a ROM file image suitable for programming.

The last step in the development process takes place inside the PSoC Designer's Debugger subsystem. The Debugger downloads the ROM image to the In-Circuit Emulator (ICE) where it runs at full speed. Debugger capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint and watch-variable features, the Debugger provides a large trace buffer and allows you define complex breakpoint events that include monitoring address and data bus values, memory locations and external signals.

Units of Measure

A units of measure table is located in the Electrical Specifications section. [Table 3-1 on page 13](#) lists all the abbreviations used to measure the PSoC devices.

Numeric Naming

Hexidecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexidecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (e.g., '01010100b' or '01000011b'). Numbers not indicated by an 'h' or 'b' are decimal.

1. Pin Information

This chapter describes, lists, and illustrates the CY8C22x13 PSoC device pins and pinout configurations.

1.1 Pinouts

The CY8C22x13 PSoC device is available in a variety of packages which are listed and illustrated in the following tables. Every port pin (labeled with a "P") is capable of Digital IO. However, Vss, Vdd, SMP, and XRES are not capable of Digital IO.

1.1.1 8-Pin Part Pinout

2. Register Reference

This chapter lists the registers of the CY8C22x13 PSoC device by way of mapping tables, in offset order. For detailed register information, reference the *PSoC™ Mixed Signal Array Technical Reference Manual*.

2.1 Register Conventions

2.1.1 Abbreviations Used

The register conventions specific to this section are listed in the following table.

Convention	Description
RW	Read and write register or bit(s)
R	Read register or bit(s)
W	Write register or bit(s)
L	Logical register or bit(s)
C	Clearable register or bit(s)
#	Access is bit specific

2.2 Register Mapping Tables

The PSoC device has a total register address space of 512 bytes. The register space is also referred to as IO space and is broken into two parts. The XO1 bit in the Flag register determines which bank the user is currently in. When the XO1 bit is set, the user is said to be in the “extended” address space or the “configuration” registers.

Note In the following register mapping tables, blank fields are Reserved and should not be accessed.

3. Electrical Specifications

This chapter presents the DC and AC electrical specifications of the CY8C22x13 PSoC device. For the most up to date electrical specifications, confirm that you have the most recent data sheet by referencing the web at <http://www.cypress.com/psoc>.

Specifications are valid for $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$ and $T_J \leq 100^{\circ}\text{C}$ as specified, except where noted. Specifications for devices running at greater than 12 MHz are valid for $-40^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$ and $T_J \leq 82^{\circ}\text{C}$.

Figure 3-1. Voltage versus Operating Frequency

The following table lists the units of measure that are used in this chapter.

Table 3-1: Units of Measure

Symbol	Unit of Measure	Symbol	Unit of Measure
$^{\circ}\text{C}$	degree Celsius	μW	micro watts
dB	decibels	mA	milli-ampere
fF	femto farad	ms	milli-second
Hz	hertz	mV	milli-volts
KB	1024 bytes	nA	nano ampere
Kbit	1024 bits	ns	nanosecond
kHz	kilohertz	nV	nanovolts
k Ω	kiloohm	Ω	ohm
MHz	megahertz	pA	pico ampere
M Ω	megaohm	pF	pico farad
μA	micro ampere	pp	peak-to-peak
μF	micro farad	ppm	parts per million
μH	micro henry	ps	picosecond
μs	microsecond	sps	samples per second
μV	micro volts	σ	sigma: one standard deviation
μVrms	micro volts root-mean-square	V	volts

3.1 Absolute Maximum Ratings

Table 3-2. Absolute Maximum Ratings

Symbol	Description	Min	Typ	Max	Units	Notes
T_{STG}	Storage Temperature	-55	–	+100	°C	Higher storage temperatures will reduce data retention time.
T_A	Ambient Temperature with Power Applied	-40	–	+85	°C	
Vdd	Supply Voltage on Vdd Relative to Vss	-0.5	–	+6.0	V	
V_{IO}	DC Input Voltage	Vss - 0.5	–	Vdd + 0.5	V	
–	DC Voltage Applied to Tri-state	Vss - 0.5	–	Vdd + 0.5	V	
I_{MIO}	Maximum Current into any Port Pin	-25	–	+50	mA	
I_{MAIO}	Maximum Current into any Port Pin Configured as Analog Driver	-50	–	+50	mA	
–	Static Discharge Voltage	2000	–	–	V	
–	Latch-up Current	–	–	200	mA	

3.2 Operating Temperature

Table 3-3. Operating Temperature

Symbol	Description	Min	Typ	Max	Units	Notes
T_A	Ambient Temperature	-40	–	+85	°C	
T_J	Junction Temperature	-40	–	+100	°C	The temperature rise from ambient to junction is package specific. See “Thermal Impedances” on page 34 . The user must limit the power consumption to comply with this requirement.

3.3 DC Electrical Characteristics

3.3.1 DC Chip-Level Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only or unless otherwise specified.

Table 3-4. DC Chip-Level Specifications

Symbol	Description	Min	Typ	Max	Units	Notes
V _{DD}	Supply Voltage	3.00	—	5.25	V	
I _{DD}	Supply Current	—	5	8	mA	Conditions are V _{DD} = 5.0V, 25 °C, CPU = 3 MHz, 48 MHz disabled. VC1 = 1.5 MHz, VC2 = 93.75 kHz, VC3 = 93.75 kHz.
I _{DD3}	Supply Current	—	3.3	6.0	mA	Conditions are V _{DD} = 3.3V, T _A = 25 °C, CPU = 3 MHz, 48 MHz = Disabled, VC1 = 1.5 MHz, VC2 = 93.75 kHz, VC3 = 93.75 kHz.
I _{SB}	Sleep (Mode) Current with POR, LVD, Sleep Timer, and WDT. ^a	—	3	6.5	μA	Conditions are with internal slow speed oscillator, V _{DD} = 3.3V, $-40^{\circ}\text{C} \leq T_A \leq 55^{\circ}\text{C}$.
I _{SBH}	Sleep (Mode) Current with POR, LVD, Sleep Timer, and WDT at high temperature. ^a	—	4	25	μA	Conditions are with internal slow speed oscillator, V _{DD} = 3.3V, $55^{\circ}\text{C} < T_A \leq 85^{\circ}\text{C}$.
I _{SBXTL}	Sleep (Mode) Current with POR, LVD, Sleep Timer, WDT, and external crystal. ^a	—	4	7.5	μA	Conditions are with properly loaded, 1 μW max, 32.768 kHz crystal. V _{DD} = 3.3V, $-40^{\circ}\text{C} \leq T_A \leq 55^{\circ}\text{C}$.
I _{SBXTLH}	Sleep (Mode) Current with POR, LVD, Sleep Timer, WDT, and external crystal at high temperature. ^a	—	5	26	μA	Conditions are with properly loaded, 1 μW max, 32.768 kHz crystal. V _{DD} = 3.3V, $55^{\circ}\text{C} < T_A \leq 85^{\circ}\text{C}$.
V _{REF}	Reference Voltage (Bandgap)	1.275	1.3	1.325	V	Trimmed for appropriate V _{DD} .

a. Standby current includes all functions (POR, LVD, WDT, Sleep Time) needed for reliable system operation. This should be compared with devices that have similar functions enabled.

3.3.2 DC General Purpose IO Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only or unless otherwise specified.

V _{OL}	Low Output Level	—	—	0.75	V	I _{OL} = 25 mA, V _{DD} = 4.75 to 5.25V (150 mA maximum combined I _{OL} budget)
V _{IL}	Input Low Level	—	—	0.8	V	V _{DD} = 3.0 to 5.25
V _{IH}	Input High Level	2.1	—	—	V	V _{DD} = 3.0 to 5.25
V _H	Input Hysteresis	—	60	—	mV	
I _{IL}	Input Leakage (Absolute Value)	—	1	—	nA	Gross tested to 1 μA.
C _{IN}	Capacitive Load on Pins as Input	—	3.5	10	pF	Package and pin dependent. Temp = 25°C.
C _{OUT}	Capacitive Load on Pins as Output	—	3.5	10	pF	Package and pin dependent. Temp = 25°C.

3.3.3 DC Operational Amplifier Specifications

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only or unless otherwise specified.

The Operational Amplifier is a component of both the Analog Continuous Time PSoC blocks and the Analog Switched Cap PSoC blocks. The guaranteed specifications are measured in the Analog Continuous Time PSoC block. Typical parameters apply to 5V at 25°C and are for design guidance only.

3.3.5 DC Analog Reference Specifications

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only or unless otherwise specified.

The guaranteed specifications are measured through the Analog Continuous Time PSoC blocks. The power levels for AGND refer to the power of the Analog Continuous Time PSoC block. The power levels for RefHi and RefLo refer to the Analog Reference Control register. The limits stated for AGND include the offset error of the AGND buffer local to the Analog Continuous Time PSoC block.

3.3.7 DC POR and LVD Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only or unless otherwise specified.

Note The bits PORLEV and VM in the table below refer to bits in the VLT_CR register. See the *PSoC Mixed Signal Array Technical Reference Manual* for more information on the VLT_CR register.

Flash _{ENT}	Flash Endurance (total) ^a	1,800,000	–	–	–	Erase/write cycles.
Flash _{DR}	Flash Data Retention	10	–	–	Years	

- a. A maximum of 36 x 50,000 block endurance cycles is allowed. This may be balanced between operations on 36x1 blocks of 50,000 maximum cycles each, 36x2 blocks of 25,000 maximum cycles each, or 36x4 blocks of 12,500 maximum cycles each (and so forth to limit the total number of cycles to 36x50,000 and that no single block ever sees more than 50,000 cycles).

For the full industrial range, the user must employ a temperature sensor user module (FlashTemp) and feed the result to the temperature argument before writing. Refer to the Flash APIs Application Note AN2015 at <http://www.cypress.com> under Application Notes for more information.

3.4 AC Electrical Characteristics

3.4.1 AC Chip-Level Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. —	Low Period with CPU Clock divide by 1	41.7	—	—	ns	
—	Power Up IMO to Switch	150	—	—	μs	

a. Maximum CPU frequency is 12 MHz at 3.3V. With the CPU clock divider set to 1, the external clock must adhere to the maximum frequency and duty cycle requirements.

b. If the frequency of the external clock is greater than 12 MHz, the CPU clock divider must be set to 2 or greater. In this case, the CPU clock divider will ensure that the fifty per-cent duty cycle requirement is met.

3.4.7 AC Programming Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only or unless otherwise specified.

Table 3-25. AC Characteristics of the I²C SDA and SCL Pins

Symbol	Description	Standard Mode		Fast Mode		Units	Notes
		Min	Max	Min	Max		
$F_{\text{SCL}2\text{C}}$	SCL Clock Frequency	0	100	0	400	kHz	
$T_{\text{HDSTA}2\text{C}}$	Hold Time (repeated) START Condition. After this period, the first clock pulse is generated.	4.0	—	0.6	—	μs	
$T_{\text{LOW}2\text{C}}$	LOW Period of the SCL Clock	4.7	—	1.3	—	μs	
$T_{\text{HIGH}2\text{C}}$	HIGH Period of the SCL Clock	4.0	—	0.6	—	μs	
$T_{\text{SUSTA}2\text{C}}$	Set-up Time for a Repeated START Condition	4.7	—	0.6	—	μs	
$T_{\text{HDDAT}2\text{C}}$	Data Hold Time	0	—	0	—	μs	
$T_{\text{SUDAT}2\text{C}}$	Data Set-up Time	250	—	100 ^a	—	ns	
$T_{\text{SUSTOI}2\text{C}}$	Set-up Time for STOP Condition	4.0	—	0.6	—	μs	
$T_{\text{BUF}2\text{C}}$	Bus Free Time Between a STOP and START Condition	4.7	—	1.3	—	μs	
$T_{\text{SPI}2\text{C}}$	Pulse Width of spikes are suppressed by the input filter.	—	—	0	50	ns	

- a. A Fast-Mode I²C-bus device can be used in a Standard-Mode I²C-bus system, but the requirement $t_{\text{SU;DAT}} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{\text{rmax}} + t_{\text{SU;DAT}} = 1000 + 250 = 1250$ ns (according to the Standard-Mode I²C-bus specification) before the SCL line is released.

4.2 Thermal Impedances

Table 4-1. Thermal Impedances per Package

Package	Typical θ_{JA} *
8 PDIP	123 °C/W
8 SOIC	185 °C/W
20 PDIP	109 °C/W
20 SSOP	117 °C/W
20 SOIC	81 °C/W
32 MLF	22 °C/W

* $T_J = T_A + \text{POWER} \times \theta_{JA}$

4.3 Capacitance on Crystal Pins

Table 4-2: Typical Package Capacitance on Crystal Pins

Package	Package Capacitance
8 PDIP	2.8 pF
8 SOIC	2.0 pF
20 PDIP	3.0 pF
20 SSOP	2.6 pF
20 SOIC	2.5 pF
32 MLF	2.0 pF

5. Ordering Information

The following table lists the CY8C22x13 PSoC Device family's key package features and ordering codes.
