

High Performance Differential Fanout Buffer

Features

- 10 differential outputs with 2 banks
- User configurable output signaling standard for each bank: LVDS or LVPECL or HCSL
- LVC MOS reference output up to 200MHz
- Up to 1.5GHz output frequency for differential outputs
- Ultra low additive phase jitter: < 0.03 ps (typ) (differential 156.25MHz, 12KHz to 20MHz integration range); < 0.02 ps (typ) (differential 156.25MHz, 10kHz to 1MHz integration range)
- Selectable reference inputs support either single-ended or differential or Xtal
- Low skew between outputs within banks (<40ps)
- Low delay from input to output (Tpd typ. < 1.7ns)
- Separate Input output supply voltage for level shifting
- 2.5V / 3.3V power supply
- Industrial temperature support
- TQFN-48 package

Description

The PI6C49S1510 is a high performance fanout buffer device which supports up to 1.5GHz frequency. It also integrates a unique feature with user configurable output signaling standards on per bank basis which provide great flexibilities to users. The device also uses Pericom's proprietary input detection technique to make sure illegal input conditions will be detected and reflected by output states. This device is ideal for systems that need to distribute low jitter clock signals to multiple destinations.

Applications

- Networking systems including switches and Routers
- High frequency backplane based computing and telecom platforms

Phase Noise and Additive Jitter

Output phase noise (Dark Blue) vs Input Phase noise (light blue)

Additive jitter is calculated at 156.25MHz~27fs RMS (12kHz to 20MHz). Additive jitter = $\sqrt{(\text{Output jitter}^2 - \text{Input jitter}^2)}$

Total phase jitter with 25MHz XTAL ~ 264fs RMS (12kHz ~20MHz)

Application Information

Wiring the differential input to accept single ended levels

Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage $V_{REF} = V_{DD}/2$ is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio of R1 and R2 might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and $V_{DD} = 3.3V$, V_{REF} should be 1.25V and $R1/R2 = 0.609$.

Figure 1. Single-ended input to Differential input device

Power Supply Filtering Techniques

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. All power pins should be individually connected to the power supply plane through vias, and 0.1μF and 1μF bypass capacitors should be used for each pin.

Clock IC Crystal loading cap. design guide

CL =crystal spec. loading cap.

C_in/out = (3~5pF) of IC pin cap.

Cb = PCB trace (2~4pF)

C1,C2 = load cap. of design

Rd = 50 to 100ohm drive level limit

Design guide: $C1=C2=2 * CL - (Cb + C_{in/out})$ to meet target +/-ppm < 20 ppm

Example1: Select CL=18 pF crystal, $C1=C2=2*(18pF) - (4pF+5pF)=27pF$, check datasheet too

Example2: For higher frequency crystal ($\Rightarrow 20MHz$), can use formula $C1=C2=2*(CL-6)$, can do fine tune of C1, C2 for more accurate ppm if necessary
