Test Circuit for Output Enable and Complementary Output

Note 1: An external 0.01µF ceramic bypass capacitor in parallel with a 0.1µF high frequency ceramic bypass capacitor close (less than 2mm) to the package ground and supply voltage pin is required.

Note 2: A low capacitance (<12pF), 10X attenuation factor, high impedance (>10Mohms), and high bandwidth (>500MHz) passive probe is recommended.

Note 3: Test circuit PCB traces need to be designed for a characteristic line impedance of 50 ohms.

The schematic diagram illustrates the experimental setup for measuring the frequency response of a common-emitter amplifier. The circuit includes the following components and connections:

- Power Supply:** A DC power supply connected to the circuit.
- Voltage Meter:** Connected in parallel with the input signal source.
- Current Meter:** Connected in series with the input signal source.
- Switch:** A switch that can be connected to the input signal source or ground.
- 100 Ohm Resistor:** A resistor connected between the input and output of the amplifier.
- Oscilloscope:** Connected to the output of the amplifier to measure the output signal.
- Frequency Counter:** Connected to the output of the amplifier to measure the frequency of the output signal.

The circuit is connected to a common-emitter amplifier circuit, which is shown in the diagram. The input signal is provided by a voltage source (V_{DD}) and the output is measured by the oscilloscope. The circuit is connected to a common-emitter amplifier circuit, which is shown in the diagram.

Note 3: Test circuit PCB traces need to be designed for a characteristic line impedance of 50 ohms.
