

NP-SAMC Series

Product Preview

50A, Ultra Low Capacitance TSPD

The NP-SAMC series of Low Capacitance Thyristor Surge Protection Devices (TSPD) protect sensitive electronic equipment from transient overvoltage conditions. Due to their ultra low off-state capacitance (C_O), they offer minimal signal distortion for high speed equipment such as DSL and T1/E1 circuits. The low nominal offstate capacitance translates into the extremely low differential capacitance offering superb linearity with applied voltage or frequency.

The NP-SAMC Series helps designers to comply with the various regulatory standards and recommendations including: GR-1089-CORE, IEC 61000-4-5, ITU K.20/K.21/K.45, IEC 60950, TIA-968-A, FCC Part 68, EN 60950, UL 1950.

Features

- Ultra Low – Micro Capacitance
- Low Leakage (Transparent)
- High Surge Current Capabilities
- Precise Turn on Voltages
- Low Voltage Overshoot
- These are Pb-Free Devices

Typical Applications

- xDSL Central Office and Customer Premise
- T1/E1
- Other Broadband High Speed Data Transmission Equipment

Detailed Operating Description

The TSPD or Thyristor Surge Protection Device are specialized silicon based overvoltage protectors, used to protect sensitive electronic circuits from damaging overvoltage transient surges caused by induced lightning and powercross conditions.

The TSPD protects by switching to a low on state voltage when the specified protection voltage is exceeded. This is known as a “crowbar” effect. When an overvoltage occurs, the crowbar device changes from a high-impedance to a low-impedance state. This low-impedance state then offers

a path to ground, shunting unwanted surges away from the sensitive circuits.

This crowbar action defines the TSPD’s two states of functionality: Open Circuit and Short Circuit.

Open Circuit – The TSPD must remain transparent during normal circuit operation. The device looks like an open across the two wire line.

Short Circuit – When a transient surge fault exceeds the TSPD protection voltage threshold, the devices switches on,

and shorts the transient to ground, safely protecting the circuit.

Figure 4. Normal and Fault Conditions

The electrical characteristics of the TSPD help the user to define the protection threshold for the circuit. During the open circuit condition the device must remain transparent; this is defined by the I_{DRM} . The I_{DRM} should be as low as possible. The typical value is less than 5 μA .

The circuit operating voltage and protection voltage must be understood and considered during circuit design. The $V_{(BO)}$ is the guaranteed maximum voltage that the protected circuit will see, this is also known as the protection voltage. The V_{DRM} is the guaranteed maximum voltage that will keep the TSPD in its normal open circuit state. The TSPD $V_{(BO)}$ is typically a 20–30% higher than the V_{DRM} . Based on these characteristics it is critical to choose devices which have a V_{DRM} higher than the normal circuit operating voltage, and a $V_{(BO)}$ which is less than the failure threshold of the protected equipment circuit. A low on-state voltage V_t allows the TSPD to conduct large amounts of surge current (500 A) in a small package size.

Once a transient surge has passed and the operating voltage and currents have dropped to their normal level the TSPD changes back to its open circuit state.

Figure 5. Protection During a Transient Surge

TSPD's are useful in helping designers meet safety and regulatory standards in Telecom equipment including GR-1089-CORE, ITU-K.20, ITU-K.21, ITU-K.45, FCC Part 68, UL1950, and EN 60950.

ON Semiconductor offers a full range of these products in the NP series product line.

DEVICE SELECTION

When selecting a TSPD use the following key selection parameters.

Off-State Voltage V_{DRM}

Choose a TSPD that has an Off-State Voltage greater than the normal system operating voltage. The protector should not operate under these conditions:

Example:

$$V_{bat} = 48 \text{ Vmax}$$

$$V_{ring} = 150 \text{ Vrms} = 150 \times 1.414 = 212 \text{ V peak}$$

V_{DRM} should be greater than the peak value of these two components:

$$V_{DRM} > 212 + 48 = 260 \text{ V}_{DRM}$$

Breakover Voltage $V_{(BO)}$

Verify that the TSPD Breakover Voltage is a value less than the peak voltage rating of the circuit it is protecting.

Example: Relay breakdown voltage, SLIC maximum voltage, or coupling capacitor maximum rated voltage.

Peak Pulse Current I_{pps}

Choose a Peak Pulse current value which will exceed the anticipated surge currents in testing. In some cases the 100 A "C" series device may be needed when little or no series resistance is used. When a series current limiter is used in the circuit a lower current level of "A" or "B" may be used. To determine the peak current divide the maximum surge current by the series resistance.

Hold Current (I_H)

The Hold Current must be greater than the maximum system generated current. If it is not then the TSPD will remain in a shorted condition, even after a transient event has passed.
