

The Safest

Emergency Stop Switches

in the World!

Your safety is our top priority

IDEC Emergency Stop switches make life easier by giving you the power to shutdown a machine, system or process instantly! Prevent or avoid risks to people or machines and give yourself one less thing to worry about when already faced with possible maintenance issues, injuries, equipment damage, machine failure or a life-threatening accident.

Conventional E-Stops may fail or malfunction from dislocation of the contact blocks due to improper installation of the switch, accidental removal of the contact block, improper wiring or even from vibration during the transportation of a finished product. By automatically turning off the machine when the contact block and actuator are improperly installed (Safe Break

Action), not only do IDEC E-Stops reduce the effects of these failures; they also exceed International safety standards (ISO13850 and EN60947-5-5).

Over the last 60 years, IDEC has manufactured many reliable, high-quality Emergency Stop switches and consistently lead the market in new technology and innovation for machine operator safety. By surpassing current international standards, IDEC E-Stops have become the safest in the world.

800-262-IDEC

Protection you can trust

All X series Emergency Stops are RoHS compliant, UL-listed (XA Series is UL recognized), cUL, TUV, CCC and CE marked.

The IDEC XN4E series of padlock-style E-Stops also meets additional safety standards including **OSHA and ISO 12100-2:2003**. OSHA (Occupational Safety & Health Administration, U.S. Department of Labor) requires that where the unexpected energization or start-up of equipment could cause injury to operators, the machine or equipment is stopped, isolated from all potentially hazardous energy sources and locked out before employees perform any servicing or maintenance. ISO 12100-2:2003 requires that risks be reduced to the lowest allowable level by taking protective measures such as: inherently safe design, safeguarding, and complementary protective measures. Locking out energy isolation devices is a complementary protective measure.

XN4E accomplishes these added safety standards by being the first and only emergency stop to enable maintenance technicians to install up to twenty personal padlocks, preventing unauthorized resetting of the latched emergency stop switch and making service safer to perform.

NISD

IDEC XW and XN Series E-Stops are listed by Underwriters Laboratories (UL) as category NISD emergency stop devices. The XA Series is UL NISD2 recognized. These ratings allow emergency stop devices, intended to be installed in a machine control system, to perform a

Category 0 or Category 1 stop function as defined in ANSI/NFPA 79, "Electrical Standard for Industrial Machinery." These devices have been investigated for functionality, in addition to fire and electric shock safety.

When Safety

Eliminate the chance of

Peace of mind

The XN series of emergency stops were specifically developed to prevent unauthorized or accidental resetting of latched E-Stop switches. How you ask?

XN4E E-Stops offer a higher level of function and safety by allowing the use of up to twelve personal padlocks. For example, when a machine requires maintenance and a technician arrives to repair it. With a conventional E-Stop, the technician presses the emergency stop, works on the machine and then resets the E-Stop to resume operation once the work is finished. But what's to

stop someone else from accidentally restarting the machine while the technician is still working? Nothing. With the new XN4E that is no longer a problem. XN4E padlock-style E-Stops prevent accidents by allowing each technician to place his or her own padlock on the E-Stop. Each one prevents resetting of the E-Stop—and restarting of the machine—until all of them have been removed by their respective owners. Sounds simple and it is, a simple way to keep everyone safe.

Press the E-Stop

Button
Latched

Install padlock

Perform
Maintenance

With the addition of 2 optional hasps, up to 12 separate personnel can secure their own unique padlock at one time. The hasp can't be removed, and the machine restarted, until all of the padlocks are removed.

Revolutionary “Safe Break Action” Design

Unrivalled safety: Safe Break Action Technology

IDEC Emergency Stop Switches include exclusive technology that has changed the way E-Stop switches are designed. This “safe break action” concept provides greater levels of human safety.

Conventional E-Stop switches are designed with spring pressure on the Normally Closed (NC) contacts, keeping them in the closed position and allowing a machine to operate. But improper installation or excessive force to the button in an emergency may break or dislodge a vital part, causing the spring loaded contact to stay closed. This situation renders the E-Stop incapable of stopping the machine, and can lead to catastrophic events, personal injury and possible loss of life.

However, IDEC X-Series E-Stops use a “safe break action,” which reverses the energy direction and uses the spring-pressure to guarantee that the NC contacts will open if the emergency switch is damaged or the contact blocks separate due to excessive force. This is the E-Stop switch you can rely on in a life threatening situation.

“Through IDEC’s innovative design, their E-Stops have increased the safety of our personnel”

Mechanical Engineer

X Series, The Safe Break Action E-Stops!

Internal view while removing the contact block

Reach for the “Safe Break Action”

When the contact block is removed from the operator the main contact (NC) is forced to open (OFF). When removing the contact block, the cam provides a direct opening action to open the contact.

Safety You Should Know About

X-Series E-Stops have lower potential energy in the “Locked” (Latching) position than in the “Normal” (Reset) position. When the switch is damaged from an excessive shock, the main contact (NC) moves toward the OFF (Safe) position.

Direct Opening Action

Even if the contacts are welded, the force applied on the button directly opens the contact.

Rated Insulation Voltage: 250V minimum
Rated Thermal Current: 5A minimum

Safety Interlock Mechanism

Contacts are opened when the operator is locked, and remain opened until the operator is unlocked intentionally. (IEC60947-5; 6:2)

Two E-Stops in One
Push to lock, Pull/Turn to Reset

The X-Series E-Stops can be reset either by pulling or turning the button. With traditional E-Stops, you need to choose between Push-Pull or Pushlock Turn Reset. With the IDEC X Series E-Stops you get both in one switch. (Except XN4E which is only Pushlock Turn Reset).

Pull Reset

Turn Reset
