

3-Pin Microprocessor Power Supply Supervisors

FEATURES

- Precision monitoring of
+5.0V (-5%, -10%, -20%),
+3.3V (-5%, -10%),
+3.0V (-10%) and
+2.5V (-5%) power supplies
- Offered in three output configurations:
 - CAT803: Open-Drain Active LOW reset
 - CAT809: Push-Pull Active LOW reset
 - CAT810: Push-Pull Active HIGH reset
- Direct replacements for the MAX803, MAX809 and MAX810 in applications operating over the industrial temperature range
- Reset valid down to $V_{CC} = 1.0V$
- 6 μA power supply current
- Power supply transient immunity
- Industrial temperature range: -40°C to +85°C
- Available in RoHS-compliant SOT-23 and SC70 packages

APPLICATIONS

- Computers
- Servers
- Laptops
- Cable modems
- Wireless communications
- Embedded control systems
- White goods
- Power meters
- Intelligent instruments
- PDAs and handheld equipment

PIN CONFIGURATION

DESCRIPTION

The CAT803, CAT809, and CAT810 are supervisory circuits that monitor power supplies in digital systems. The CAT803, CAT809, and CAT810 are direct replacements for the MAX803, MAX809 and MAX810 in applications operating over the industrial temperature range.

These devices generate a reset signal, which is asserted while the power supply voltage is below a preset threshold level and for at least 140 ms after the power supply level has risen above that level. The underlying floating gate technology, AE²(TM) used by Catalyst Semiconductor, makes it possible to offer any custom reset threshold value. Seven industry standard threshold levels are offered to support +5.0V, +3.3V, +3.0V and +2.5V systems.

The CAT803 has an open-drain \overline{RESET} output (active LOW). The CAT803 requires a pull-up resistor on the reset output.

The CAT809 features a push-pull \overline{RESET} output (active LOW) and the CAT810 features a push-pull RESET output (active HIGH).

Fast transients on the power supply are ignored and the output is guaranteed to be in the correct state at V_{CC} levels as low as 1.0V.

The CAT803, CAT809, and CAT810 are available in both the compact 3-pin SOT-23 and SC70 packages.

DETAILED DESCRIPTIONS

RESET TIMING

The reset signal is asserted LOW for the CAT803/CAT809 and HIGH for the CAT810 when the power supply voltage falls below the threshold trip voltage and remains asserted for at least 140ms after the power supply voltage has risen above the threshold.

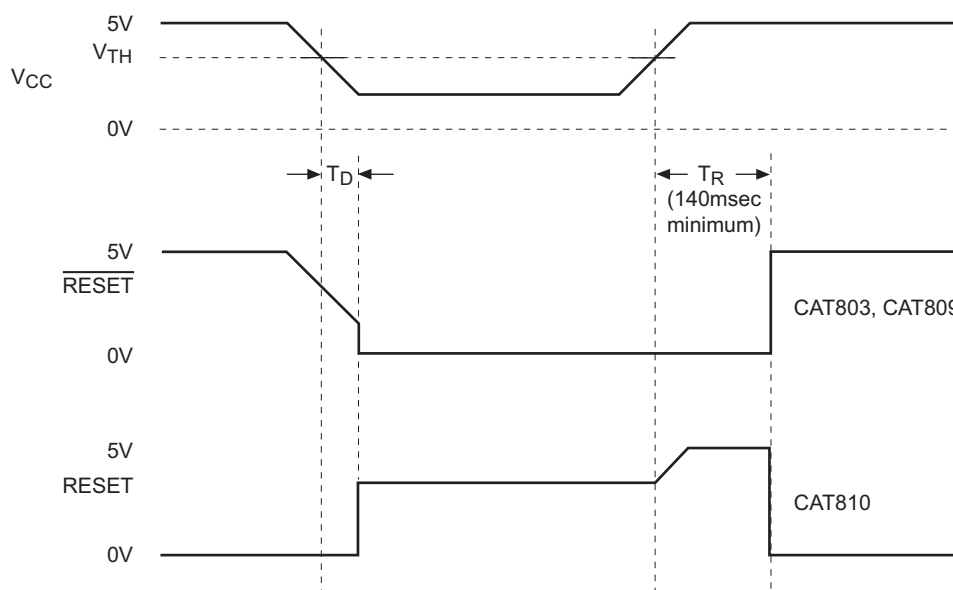

Figure 1. Reset Timing Diagram

VCC TRANSIENT RESPONSE

The CAT803/CAT809/CAT810 protect μ Ps against brownout failure. Short duration transients of 4 μ sec or less and 100mV amplitude typically do not cause a false RESET.

Figure 2 shows the maximum pulse duration of negative-going V_{CC} transients that do not cause a reset condition.

As the amplitude of the transient goes further below the threshold (increasing $V_{TH} - V_{CC}$), the maximum pulse duration decreases. In this test, the V_{CC} starts from an initial voltage of 0.5V above the threshold and drops below it by the amplitude of the overdrive voltage ($V_{TH} - V_{CC}$).

Figure 2. Maximum Transient Duration Without Causing a Reset Pulse vs. Reset Comparator Overdrive

VALID RESET WITH V_{CC} UNDER 1.0V

To ensure that the CAT809 $\overline{\text{RESET}}$ pin is in a known state when V_{CC} is under 1.0V, a $>10\text{k}\Omega$ pull-down resistor between $\overline{\text{RESET}}$ pin and GND is recommended. For the CAT810, a pull-up resistor from RESET pin to V_{CC} is needed.

Figure 3. $\overline{\text{RESET}}$ Valid with V_{CC} Under 1.0V

Figure 4. RESET Valid with V_{CC} Under 1.1V

BI-DIRECTIONAL RESET PIN INTERFACING

The CAT809/810 can interface with $\mu\text{P}/\mu\text{C}$ bi-directional reset pins by connecting a $4.7\text{k}\Omega$ resistor in series with the CAT809/810 reset output and the $\mu\text{P}/\mu\text{C}$ bi-directional reset pin.

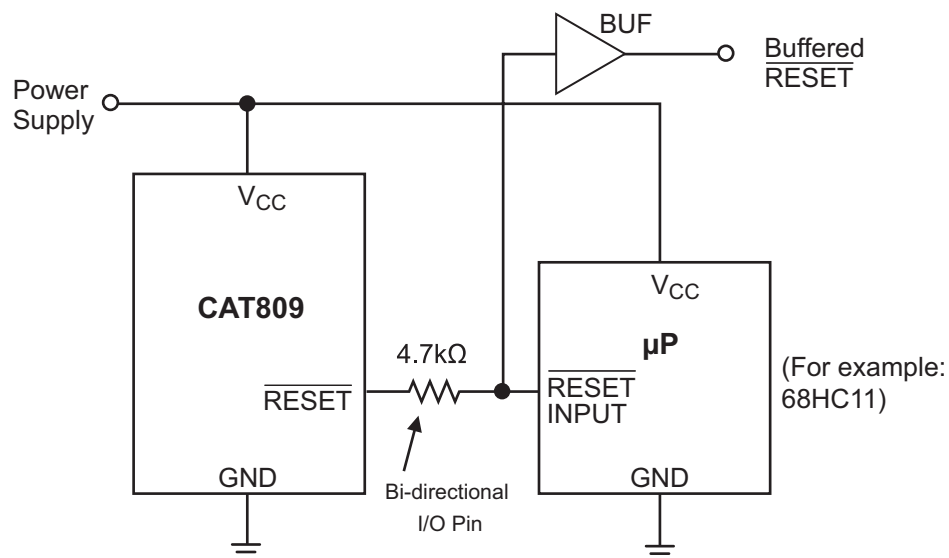

Figure 5. Bi-directional Reset Pin Interfacing

CAT803, CAT809, CAT810

CAT803 OPEN-DRAIN RESET APPLICATION

The CAT803 features an open-drain RESET output and therefore needs a pull-up resistor on the output for proper operation, as shown on Figure 6. An advantage of the open-drain output includes the ability to “wire AND” several outputs together to form an inexpensive logic circuit. It is also possible to have the pull-up resistor connected to a different supply which can be higher than the CAT803 V_{CC} pin. The value of the pull-up resistor is not critical in most applications, typical values being between 5k Ω and 10k Ω .
