About

Hasco Components International Corporation was established in 1976 as a reed switch and reed relay company. In 1979 Hasco added electromechanical relays to its line. It's mission has been simple. Produce high quality parts, keep a large inventory, keeps costs down and most important, give everyone you are dealing with 100% personal attention. Our founder once said, "anyone can sell a relay, Hasco sells service."

[Our Factory:](#)

Deal with the manufacturer and not an importer

Since the mid 1990's Hasco has made its own relays in our own factory. Buying relays from a company with over three decades of experience that produces its own parts is better than buying them from someone who imports them from different factories. Factory Tours are Available

[Sales & Service: 516-328-9292 email: \[info@hascorelays.com\]\(mailto:info@hascorelays.com\)](#)

Sales are done through our headquarters in New York or our branch office in Shanghai for overseas inquiries. Hasco also has 15 affiliated sales rep offices as well as a stocking branch in Brazil. Drop shipments world wide are available to save time and money.

[Hasco Stocks!](#)

For over 30 years Hasco has kept a large inventory of relays, reed switches and reed relays as well as magnets and proximity sensors in New York. We also keep inventory at our factory outside of Shanghai. Hasco specializes in JIT and Kanban programs.

[Hasco Clients:](#)

Presently we help sample, engineer and supply to the following industries. These include automotive, security and fire, UPS, Telecom, industrial controls, HVAC, lighting controls and liquid level sensors to name a few.

[No Time to Read a Catalog?](#)

Free specifying is available by our engineering experts. We recommend you stop taking the time to go through web and catalog pages. Rather than going through web or catalog pages why not simply tell us what you need. Simply advise us the number of the poles needed, switching voltage and current as well as the coil voltage? We can save you time by recommending the best relay at the lowest cost in a matter of minutes.

For instant help call: 516 328 9292 8:15AM to 5:30 PM or email: info@hascorelays.com

MERCURY WETTED REED RELAYS AVAILABLE

ENGINEERING DATA

Operate Time: 0.5 mSec max.

Release Time: 0.2 mSec max.

Bounce Time: 0.5 mSec max.

Contact Resistance:

150 mΩ max. (initial)

Life Expectancy:

50 x 10⁶ operations at signal level

3 x 10⁶ at full rated load

Insulation Resistance: 10⁹Ω min.

Vibration: 20G (10-2000 Hz)

Thermal Shock: -55 ~105°C

Moisture Resistance:

60°C-90% 240 hours

Terminal Strength: 225g

Operating Temperature: -40 ~85°C

Storage Temperature: -55 ~105°C

POWER CONSUMPTION 150mW SMALL SIZED POLARIZED RELAY BEING CAPABLE FOR WIDE USE

FEATURES

- High sensitive 2 pole relay suitable for signal circuit
- Ultra-high sensitive type 150mW.
High sensitive type 200mW. Standard type 400mW
- Latching type relay provided with memory function is available too
- Adopts twin contacts that are superior in contact reliability
- Gold-clad Silver palladium contact available too
- Completely enclosed type relay with sealed construction being superior in durability to the environment
- UL File No. 75887
- CSA File No. 180958 (LR93742)
- BABT Certificate No. 609662

APPLICATIONS

- Switch board. Facsimile. Telephones
- Audio equipment. Industrial machines

SUBMINIATURE RELAYS T SERIES

Compact, Highly Sensitive Relays with
Balanced Armature Mechanism

FEATURES

- Compact size and low profile: 5H x 14L x 9W (mm)
- Meets FCC part 68 requirements
- High sensitivity: 140 mW nominal operating power
- Dual-in line packaging arrangement fits IC socket
- Single latching type available
- Fully sealed (immersion cleanable)
- UL/CSA

 File E75887

 File LR49291

SPECIFICATIONS

Contacts

Arrangement 2 Form C (DPDT)	
Type Bifurcated crossbar	
Material Movable contact	Ag-Pd alloy
Station contact	Gold-clad Ag-Pd alloy
Rating (resistive load)	
Max. switching power	30W DC, 62.5VA AC
Max. switching voltage	125V DC/AC
Max. switching current	1A DC/AC
UL/CSA rating 1A 30V DC, 0.5A 125V AC	
Expected life (min. operations)	
mechanical	100 million
Electrical (resistive load)	0.2 million at 1A 30V DC 0.1 million at 0.5A 125V AC
Contact Resistance	50mΩ max. at initial value

Single side stable	Minimum operating power	80 to 110mW
	Nominal operating power	140 to 200mW
1 Coil latching	Minimum set and reset power	60 to 80mW
	Nominal set and reset power	100 to 150mW

Characteristics (at 20° C)

Single side stable	Max. operate time	3mS
	Max. release time (not including bounce)	3mS
Latching	Max. set time	3mS
	Max. reset time (not including bounce)	3mS
Dielectric withstand voltage		
Between open contacts		1000V AC
Between coil and contacts		1000V AC
Between contact poles		1000V AC
Surge withstand voltage		
Between open contacts		1500V AC
Between coil and contacts		1500V AC
Between contact poles		1500V AC
Insulation resistance		
Vibration resistance		
Functional		3mm DA, 10 to 55Hz
Destructive		5mm DA, 10 to 55Hz
Shock resistance		
Functional		50G (11mS)
Destructive		100G (6mS)
Temperature range		
Thru-hole type		-40°C to 70°C
Weight		Approx. 1.5g

SURFACE MOUNT TYPE--Soldering & Mounting

Recommendations

1. Conditions for terminal soldering by reflow soldering method.

a. In case of infrared soldering

$T_1 = +120^\circ\text{C}$ to $+150^\circ\text{C}$ $t_1 = 60\text{s}$ to 90s
 $T_2 = +180^\circ\text{C}$ to $+200^\circ\text{C}$ $t_2 = 30\text{s}$ max.
 $T_3 = +245^\circ\text{C}$ max.

b. In case of vapor phase soldering

$T_1 = +120^\circ\text{C}$ to $+150^\circ\text{C}$ $t_1 = 40\text{s}$ to 60s
 $T_2 = +180^\circ\text{C}$ to $+200^\circ\text{C}$ $t_2 = 60\text{s}$ max.
 $T_3 = +215^\circ\text{C}$ max.

2. Usage of stand-off A & B in base area.

The Stand-offs shown in the Fig. 3 are designed to anchor relays temporarily to PC board with glue before terminal soldering.

GENERAL SPECIFICATIONS

Contact Material: silver cadmium oxide with copper base
Max. continuous rated voltage: 110% of nominal voltage.
Pull-In voltage: 75% of nominal voltage. Max @ 25°C.
Drop-Out voltage: 10% of nominal voltage. Min @ 25°C.
Contact Resistance: 20 mΩ max. (Initial value)
Operating Temp: Class B: -20°C to 85°C
Class F: -20°C to 105°C

Insulation Resist: DC 500V 10 MΩ min.

Dielectric Strength: AC 2000V between contact and coil, frame and contact, coil and frame one minute. AC 1500V between contacts one minute.

Operate Time: approx. 15 ms.

Release Time: approx. 10 ms.

Electrical Life: 10 x 10⁴ operation min. for 30A resistive load (N.O.)
5 x 10⁴ operations min. for 40A Resistive Load (N.O.)

Mechanical Life: 10 x 10⁶ operation min.

CONTACT

(1) Contact arrangement

Denotes the contact switching combinations available on a relay and are defined in terms of number of poles, number of throws (single or double), normal position (open or close), and the sequence to make and break.

Fundamental contact arrangements are given in Table 1.

(2) Contact type

The one structure of contact forming the contact parts, Single contact and Bifurcated contact are offered.

(3) Contact material

The contacts are fastened to the movable leaf spring and stationary terminal to ensure electrical contact. Usually they are made of materials that mainly consist of silver because of its high electrical and thermal conductivity. For small-current loads, the gold-plated or the gold-overlay silver contacts are generally used.

(4) Contacting

The typical power, voltage or current, which a relay can turn on and off under specified conditions of load, ambient temperature and humidity. Usually, the contact rating refers to resistive load.

(5) Max. switching power

The upper limit of power which can be switched by the contacts. This value will be lower than the product of the maximum voltage and the maximum current. Care should be taken not to be exceed this value.

(6) Max. switching voltage

The maximum open circuit voltage which can safely be switched by the contacts. AC and DC voltage maximums will differ in most cases.

(7) Max. switching current

The maximum current which can safely be switched by the contacts. AC and DC current maximums may differ.

(8) Min. switching current

The minimum value of current that can be reliably switched by the contacts.

(9) Contact resistance

The electrical resistance of closed contacts measured at their associated terminals.

Table 1 Fundamental contact arrangement

Form	Description	Symbol	Performance
A	Make (NO)		The combination in which the contacts are open in normal or unoperated position.
B	Break (NC)		The combination in which the contacts are closed in the unoperated position.
C	Transfer (BBM)		The combination in which Form B (NC) contact open before Form A (NO) contacts close.
D	Continuous (BBM)		The combination in which Form A (NO) contact close before Form B (NC) contacts open.

Note: 1. Abbreviations used to define the nature of the contacts are as follows:

NO: Normally open M: Make BBM: Break before Make
NC: Normally closed B: Break MBB: Make before Break

2. Double switching combinations are called 2 Form A (2A) or 2 Form C (2C).

3. The following abbreviations are used occasionally.

SP: Single pole ST: Single throw
DP: Double pole DT: Double throw

Ex. SPST NO : 1 Make (1 Form A or 1a)
SPST NC : 1 Break (1 Form B or 1b)
SPDT : 1 Transfer (1 Form C or 1c)
DPDT : 2 Transfer (2 Form C or 2c)
4 PDT : 4 Transfer (4 Form C or 4c)

COIL

(1) Nominal voltage

A single value of voltage intended to be applied to the coil.

(2) Nominal power

The value of power used by the coil at nominal voltage. For DC coils, expressed in Watts.

$$\text{Nominal power} = \frac{V^2}{R}$$

V: Nominal Voltage

R: Coil Resistance (at 20°C)

(3) Coil resistance

The resistance of the coil for temperature conditions listed in the catalog. (usually at 20°C/68°F)

(4) Pick-up (Set) voltage

When the coil voltage is increased gradually from 0V, the relay will operate at a certain voltage. This voltage is called the Pick-up voltage. The Pick-up voltage in the catalog shows the maximum value. In case of latching relay, the Pick-up voltage is called the Set Voltage.

(5) Drop-out (Reset) voltage

When the coil voltage on an operate relay is decreased gradually, the relay will release at a certain voltage. This voltage is called the Drop-out voltage. The Drop-out Voltage in the catalog shows the minimum value. In case of latching relay, the Drop-out voltage is called the Reset voltage, when the reverse voltage is increased on the coil of operate relay, the voltage which the relay will release.

(6) Operating power

The value of power used by the coil at Pick-up voltage

(7) Max. continuous voltage

The maximum value of voltage that can be applied continuously to the coil without causing damage.

(8) Operating function

• Single side stable type:

Relay which turns on when the coil is energized and turns off when de-energized.

• 1 Coil latching type:

Relay with a latching construction that can maintain the on or off state with a pulse input. With one coil, the relay is set or reset by applying signals of opposite polarities.

• 2 Coil latching type:

Relay with a latching construction composed of 2 coils, set coil and reset coil. The relay is set or reset by alternately applying pulse signals of the same polarity.

* SINCE 1976 *

MAIN POINTS TO SELECT SUITABLE RELAY

A relay may meet with a variety of ambient conditions during actual usage. In order to avoid unexpected failure in result, testing over practical range under actual operating condition is required. For proper use of relays, the characteristics of the selected

relay should be well known, and the conditions of relay use has to be investigated to determine whether they are matched to the environmental conditions. In addition, the coil conditions, contact conditions, and the ambient conditions for the relay that is actu-

ally used must be sufficiently known in determining the relay specifications. The table below shows a summary of points of consideration for relay selection. It may be used as a reference for investigation of items and points of caution.

Table 2. Main Points to Select Relays

Item	Specification Points	Consideration Points
Contact	Contact arrangement	Contact forms, number of poles, Contact sequence
	Contact load	Level of load, AC or DC, resistive or inductive or capacitive, counter voltage of inductive load
	Contact material	Contact material should be matched to the level of load
	Life	Number of operations, Frequency in switching
Coil	Coil voltage	Nominal voltage, power source ripple
	Pick-up and Drop-out voltage	Fluctuation in supply voltage, Rise in Pick-up and Drop-out voltage due to the coil resistance rise
	Coil resistance	Power consumption of coil. Increase of resistance due to the coil temperature rise
	Temperature rise	Ambient temperature and coil temperature rise according to the applied voltage.
Insulation	Dielectric strength Surge withstand voltage Insulation resistance	Do specifications of the relays match that required in the equipment?
Environment	Ambient temperature and humidity	Range of ambient temperature and humidity in the use location.
	Vibration and shock	Level of vibration and shock in the use location.
	Ambient atmosphere	No presence of gas which may cause contact failure.
Others	Mounting method	The method of flux coating, soldering, washing and mounting
	Cover	Material of cover (compatibility with washing solution)
	Relay construction	Sealed or non-sealed type relays
	Special condition	Are there any special conditions?

CONTACT

(1) Contact load

The phenomena in the contacts of relays greatly vary depending on contact load level such as kind of load and current level as well as contact material and size, opening speed and contact bounce.

• Switching current

AC current is alternately reduced to zero but DC current is not, so the arc discharge current at breaking of load current is hard to be extinguished for DC current. Therefore the duration of the arc discharge is longer in DC circuit than AC circuit and the maximum DC switching current is smaller than AC load.

• Resistive load

Resistive load is a standard load in life tests and the contact ratings in catalogue are usually specified with resistive load. In resistive load circuit, it is assumed that there is no inrush or counter breaking current on switching of loads.

• Inductive load

Inductive loads such as electromagnetic relay, solenoids and motors easily generate a high counter voltage between their coils and cause arc discharge across the relay contacts.

Because the level of inductive load is affected by the load current and the power factor (cos ϕ), the life is decreased when the power factor is lowered.

In circuit with load such as motor, solenoid, transformer and others, an inrush current

of several times larger than the steady current is generated at the time of connecting the load.

It is necessary to select the contact that has a sufficient capacity for the conditions.

• Capacitive load

In a capacitive load circuit, an inrush current of 20 to 40 times larger than the steady state current is produced. A surge suppressor should be used to prevent contact welding.

Table 3. Typical Load and Inrush Current

Kind of Load	Inrush current
Resistive load	Steady state current
Solenoid load	10 ~ 20 times of the steady state current
Motor load	5 ~ 10 times of the steady state current
Incandescent lamp load	10 ~ 15 times of the steady state current
Mercury lamp load	Approx. 3 times of the steady state current
Condenser load	20 ~ 40 times of the steady state current
Transformer load	5 ~ 15 times of the steady state current
Contact load	3 ~ 10 times of the steady state current

(2) Contact material

Relay contacts must be made from material that allows contact resistance to be low and stable, that is not quickly worn by the arc, and that has a high fusing point. At present there is no material that meets these conditions, and it appears unlikely that one will be found in the near future.

(3) Low level circuit

Circuits with several volts and several mA or less are called low-level circuits. At low levels, silver contacts form an oxide or sulfide film on their surface under certain conditions, which makes contact resistance unstable.

If the circuit impedance is high, although the high contact resistance itself does not cause problems, the noise is easily produced.

To maintain stability of contact resistance in a sulfurating atmosphere, contacts of gold overlaid on silver-palladium are effective.

* SINCE 1976 *

COIL

(1) Coil voltage of DC relay

For the operation of DC relays, standards exist for power source voltage, with DC voltage standards set at 5, 6, 9, 12, 24 and 48. Because of the gradual increase or decrease of the current impressed on the coil causing possible delay in movement of the contacts, there is a possibility that the specified contact capacity may not be satisfied. So, consideration should be given to the method of applying voltage on the coil.

(2) Power source fluctuation

As a power source for DC relays, a battery or either a half or full wave rectifier circuit with smoothing capacitor is used.

The characteristics with regard to the excitation voltage of the relay will change depending on the type of power source, and thus, in order to display stable characteristics, the most desirable method is perfect DC.

In the case of ripple included in the DC power source, if the smoothing capacitor is too small, humming develops and unsatisfactory condition is produced, due to the influence of the ripple.

This ripple is calculated using the formula described in Fig. 4 and it is necessary to give consideration to use of a power source with less than a 5% ripple.

(3) Coil resistance

The resistance of coil is specified according to the nominal voltage of the relay. Generally, the nominal value of coil resistance is that at 20°C (68°F) and the allowable range is limited to within ±10%.

ed to within ±10%.

The resistance/temperature relationship for copper wire is about 0.4% for 1°C, and with this ratio, the coil resistance increases.

In order to operate the relay, the voltage necessary, becomes higher than the specified voltage accompanying the rise in the coil resistance.

Fig. 4. Ripple factor of rectifier circuit

$$\text{Ripple factor} = \frac{E_{\text{max}} - E_{\text{min}}}{E_{\text{mean}}} \times 100 (\%)$$

E max. = Maximum value of ripple portion

E min. = Minimum value of ripple portion

E mean = Average value of ripple portion

PERFORMANCE

(1) Contact resistance

(a) Contact wipe

The contact resistance of clean surface is extremely low, such as several mΩ. In practice, some kind of film is formed on to almost all of the contact surfaces and the contact resistance varies depending on the properties of that film.

To clean such film and stabilize contact resistance, distance of the contact wipe is increased.

When contacts open and close, the contacted surfaces slid together, thus effecting a breakage of nonconductive film formed on the contact surfaces.

(b) Contamination of contact surface

The possible causes of contamination that effects increases in contact resistance are as follows.

- Adherence of fiber, scale and particles of plastic mold, etc.
- Adherence of silicone oxides.
- Adherence and deposits of non-conducting material produced through a chemical reaction with the gas absorbed onto the contact face.
- Adherence and deposits of carbon powders produced at contact surface.
- Oxidation and sulfuration of metallic powders on the contact surface.

(c) A bifurcated contact is contaminated

The bifurcated spring is cut deeply enough and separated so as to provide a good independence in a contact even when some insulating particle is trapped between the contact on one side.

In this case, the contact of the other side can

serve to maintain a good contact, with the sufficient mechanical independence between the two members. So, the bifurcated contacts have successfully reduced contact failures.

(d) Sealed relay

Sealed relays are available. This feature excludes the ingress of organic gases and dust in atmosphere and allows immersion cleaning.

When a sealed type relay switches the load in the presence of organic gases inside relay, it produces carbon powders on the contacts which create rise of contact resistance and acceleration of contact consumption. In order to avoid such problems, the constituent components are annealed for physical and chemical stability. This annealing process drives off residual volatiles in the plastics, insuring a contaminant free environment inside the sealed relay, resulting in more stable contact resistance over life.

(2) Coil

- Nominal Coil Voltage (Rated Coil Voltage)

A single value voltage intended by design to be applied to the coil or input.

- Pick-up Voltage (Pull-In Voltage or Must Operate Voltage)

When the voltage on an unoperated relay is increased, the value at or below which all contacts must function (transferred). The pick-up voltage is generally assigned to 70% of nominal coil voltage so that the relay can function without failure owing to fluctuation of voltage supplied, ambient temperature raise and irregularity of coil resistance.

- Drop-out Voltage (Release or Must Release Voltage)

When the voltage on an operated relay is decreased, the value at or above which all contacts must revert to their unoperated position. The drop-out voltage is generally assigned to 10% of nominal coil voltage. Figure 5 shows the relationship between Pick-up Voltage and Drop-Out Voltage.

Fig. 5. Relationship of Relay Performance

* SINCE 1976 *

PERFORMANCE

(3) Coil temperature rise

When voltage is applied to a coil, its temperature increases due to Joule heat. Coil temperature rise can be calculated from the temperature coefficient of the copper wire by measuring the coil resistance. The coil temperature rise can be obtained by the next expression.

$$T = T_2 - T_a = \frac{R_2 - R_1}{RI} (K + T_1) + T_1 - T_a$$

where, T: Coil temperature rise (°C)

T₁: Initial ambient temperature (°C)

T₂: Coil temperature after the test (°C)

T_a: Ambient temperature after the test (°C)

R₁: Coil resistance at T₁ °C (Ω)

R₂: Coil resistance at T₂ °C (Ω)

K: Constant (= 235 for copper wire)

however, $|T_1 - T_a| \leq 5$ (°C)

(4) Hot coil and Cool coil

The coil temperature with no voltage applied on the coil is usually to be equal to the ambient temperature. When voltage is applied to the coil, the coil temperature rises, increasing both coil resistance and pick-up voltage. The coil with its temperature rise due to voltage impression is called a Hot Coil. To the contrary, when no voltage is impressed on coil, the coil temperature of which is equal to ambient temperature, is called a Cool Coil.

In general, the values for characteristics such as pick-up voltage, drop-out voltage and so on are measured at the ambient temperature of 20°C 68°F, Cool Coil conditions. For the Hot Coil, because of its pick-up voltage rise, there is a possibility that it may not operate under the same conditions as Cool Coil. Thus, care is required.

(5) Operating range

(a) Maximum continuous voltage

The maximum voltage that can be applied continuously to the coil without causing damage. When a voltage greater than the maximum continuous voltage is applied to the coil (layers may short) the coil may burn out, due to the temperature rise. Do not exceed the usable operating range shown in the Fig. 7.

(b) Pick-up voltage

As the ambient temperature rises, the coil resistance increases, pick-up voltage. Figure 7, line B refers to the relationship. The upper

Coil temperature rise

Fig.6 (b)

Figure 6(a) shows the duration characteristics. **Fig. 6(b)** shows the voltage characteristics in a steady state at constant supply voltage.

portion of line-B in Fig. 7 shows the range of voltage which can be applied to the coil. Line-A is maximum continuous voltage. Thus the relay operating range is the portion surrounded by line A and B.

In order to have stable operation of relay, the APP voltage and the ambient temperature should be in the operating range. If the ambient temperature increases, pick-up voltages rises, while maximum continuous voltage decrease. Care is required.

Fig. 7 Operating range

(6) Operate time and Release time

There is variation in Operate time and Release Time depending upon voltage/power applied to coil.

Figure 8 shows an example of relationship between Operate Time and Release Time. Figure 8 refers to the phenomenon that according to the fluctuation of coil impressed voltage, Operate Time greatly varies, while Release Time is small. To the extent of large coil impressed voltage, the Operate Time is rapid, but if it is too rapid, the make contact bounce time may be extended.

Fig. 8 Operate and Release time

(7) Safety standards

Laws and regulations demand securing the safety of users from dangers such as electric shock and fire lying around household appliances and other consumer electric equipment or devices.

Major industrial countries across the world already have their own safety standards such as those under control of 'The Electrical Appliance and Material Control Law' in Japan, UL in U.S. .A., CSA in Canada, VDE in Germany, SEMKO in North Europe and BS in GB.

AMBIENT ENVIRONMENT

(1) Silicone compound atmosphere

Silicone compounds such as silicone rubber, silicone paint, silicone grease, etc. emit volatile silicone gas. Note that when silicone is used near relays, switching contacts in the presence of its gas causes silicon to adhere to the contacts and may result in contact failure. In this case, use a substitute that is not silicone based. If the use of silicone com-

pound is inevitable, use a plastic-sealed relay.

(2) Influence of external magnetic field

When transformers, speakers or magnets are located near a relay the characteristics may change and faulty operations may result due to the strong magnetic field generated from the equipment.

The influence depends on the strength of the magnetic field and it should be checked at the installation. In such a case suitable measures such as magnetic shielding or selection of adequate in arrangement of relay should be taken so as to avoid problems.

* SINCE 1976 *

MOUNTING OF RELAYS

(1) Mounting direction

Mounting direction is important for optimum relay characteristics.

(2) Shock and vibration resistance

It is ideal to mount the relay so that the movement of contacts and armature is perpendicular to the direction of vibration or shock, as shown in Fig. 10.

(3) Contact reliability

It is recommended to mount the relays so that the surfaces of its contacts are vertical and in Lipper location of relay inside. Such mounting methods prevent dirt and dust as well as scattered contact material (produced due to large loads from which arcs are gen-

erated) and powdered metal from adhering to them. Furthermore, it is not desirable to switch both a large load and a low level load with a single relay. The scattered contact material produced when switching large load adheres to the contacts when switching the low level load and may cause contact failure. Therefore, avoid mounting the relay with its low level load contacts located below the large load contacts.

(4) Adjacent mounting

When many relays are mounted close together, abnormally high temperatures may result from the combined heat generated. Mount relays with sufficient spacing

between them to prevent heat buildup. This also applies when a large number of boards mounted with relays are installed as in a card rack. Be sure the ambient temperature of the relays does not exceed the value listed in the catalog.

Fig 10. Direction of relays

RELAY SOLDERING AND WASHING GUIDELINES

Process

1. Mounting of relay

2. Flux coating

3. Preheating

4. Soldering

5. Cooling

Guidelines

- Avoid bending and terminals to make the relay self-clinching. Relay performance cannot be guaranteed if the terminals are bent.

- Adjust the position of the PC board so that flux does not overflow onto the top of it.
- Use rosin-based flux, which is non-corrosive and requires no washing.
- Do not use Automatic Flux Coating Method to dust-cover type relays.
- Do not overflow onto the top of PC Board, in such a case, the flux may even penetrate a flux-resistant type relay.

- Be sure to preheat before soldering.
- Preheating acts to improve solderability.
- Preheat according to the following conditions.

Temperature	100°C 212°F or less
Time	Within approx.1 minute

- Note that long exposure to high temperatures (e.g. due to a malfunctioning unit) may affect relay characteristics.

Automatic Soldering

- Flow solder is the optimum method for soldering.
- Adjust the level of solder so that It does not overflow onto the top of the PC board.
- Unless otherwise specified, solder under the following conditions depending on the type of relay.

Solder Temperature	Approx. 250°C 482°F
Soldering Time	Within approx. 5 seconds
Solder Ratio	Sn/Pb = 60/40 or 63/37

Hand Soldering • Keep the tip of the soldering iron clean.

Solder Iron	30W to 60W
Iron Tip Temperature	Approx. 300°C 572°F
Solder Time	Within approx. 3 seconds

- Immediate air cooling is recommended to prevent deterioration of the relay and surrounding parts due to soldering heat.
- Although the sealed type relay can be cleaned, avoid immersing the relay into cold liquid (such as washing solvent) immediately after soldering. Doing so may deteriorate the sealing performance.

* SINCE 1976 *

RELAY SOLDERING AND WASHING GUIDELINES

Process

6. Washing

7. Coating

Guidelines

- Do not wash flux-resistant type relays and dust cover type relays by immersion.
- Careless washing may cause washing solvent to penetrate the relay.
- Plastic sealed type relays can be washed by immersion. Use washing solvents shown in Table 6.
- Use of other washing solvents may damage the relay case and cover, and also cause washing solvent to penetrate the relay.
- Avoid ultrasonic washing on relays. Use of ultrasonic cleaning may cause breaks in the coil or slight sticking of contacts due to the ultrasonic energy.

Table 6. Washing solvent compatibility chart for sealed relays

Washing solvent	
Chlorinated	Chlorothene VG, N Trichloroethylene Perchloroethylene Methylene chloride
Alcohol	Ethanol IPA
Aqueous	Hollis 310 Indusco 624, 1000 Lonco Terg

- If the PC board is to be coated to prevent the insulation of the PC board from deteriorating due to corrosive gases and high temperature, note the following.
 - Do not coat dust-cover type relays and flux-resistant type relays.
 - Depending on the type, some coating materials may have an adverse affect on relays, select coating materials carefully.

RELAY TERMINOLOGY: PERFORMANCE

(1) Operate (Set) time

Time from initial energization to the first opening of closed contact or first closing of open contact. This time does not include any bounce time. In case of latching relays, this is called "Set time". (cf. Fig. 1.)

(2) Release (Reset) time

Time from initial de-energization of the relay coil to first opening of closed contact or first closing of open contact. This time does not include any bounce time. In case of latching relays, this is called "Reset time".

This means the time from initial reverse energization of the coil to first opening of closed contact or first closing of open contact. (cf. Fig. 1.)

(3) Bounce time

Internally caused intermittent and undesired opening of closed contact or closing of open contacts of a relay. (cf. Fig. 1)

(4) Dielectric strength

The maximum allowable AC (RMS) voltage (50/60 Hz) which may be applied between two specified test points, usually for 1 minute in duration. In general, the maximum leak current is 1 mA.

(5) Surge withstand voltage

The maximum allowable peak surge voltage which may be applied between two specified test points.

Usually, wave form of this test is specified indicating peak value, rise time and fall time. (cf. Fig. 2.) In FCC Part 66, T1 = 10 μ S, Vp 1500V are specified.

(6) Insulation resistance

The resistance between all mutually insulated conducting sections of the relay. This value changes depending on the ambient temperature and humidity.

Fig. 1 Typical time traces of relay

Fig. 1 Wave form of Surge test

* SINCE 1976 *

RELAY TERMINOLOGY: PERFORMANCE

(7) Capacitance

The electrostatic capacitance between mutually insulated conducting sections of the relay. Usually this value is measured at 1 kHz.

(8) Life

• Mechanical life

The minimum number of operations which the relay can be operated under nominal conditions with no load on the contacts.

• Electrical life

The minimum number of operations which the relay can be operated under nominal conditions with specified load on the contacts.

(9) Vibration resistance

The resistance to the vibration applicable to the relay, expressed as a displacement and frequency range.

• Functional

The vibration which can be applied to the relay during service without causing the openings of the closed contacts for more than the specified time.

• Destructive

The vibration which can be allowed by the relay during shipping, installation, without damages and changes in its operating characteristics.

(10) Shock resistance

The resistance to the shock applicable to the relay, expressed as an acceleration in G.

• Functional

The shock can be applied to the relay during service without causing the openings of the closed contacts for more than the specified time.

• Destructive

The shock which can be allowed by the relay during shipping, installation, without damage and changes in its operating characteristics.

(11) Temperature range

The range of ambient temperature in which the relay can be used without damages in its characteristics or functions.

(12) Safely standard

Standard for the prevention of electric shock hazards and fire accidents differs in content from country to country.

UL (U.S.A.), VDE (Germany)
SEMKO (Sweden), CSA (Canada)
BS (G.B.)

(13) Structure of relays

Relays are classified in 4 types as Fig. 3 by the structure of terminals, cover and case, and mounting method of the relay.

Fig. 3. Structure of relays

(Y: Yes N: No)

Item	Dust cover Type	Flux Free Type	Sealed Type	Surface Mount Type
Structure				
Characteristics	Most basic construction and there is gap between cover and base, and between base and terminals.	Terminals are sealed with base by sealant. The joint level between cover and base is higher than the PC board surface.	All the gaps between case and base, base and terminals are sealed by sealant.	All the gaps between case and base, base and terminals are sealed by sealant. Terminals are formed in "L" shape intended to be soldered by reflow soldering.
Mounting Method	Insertion mounting	Insertion mounting	Insertion mounting	Surface mounting
Automatic Flux Coating	N	Y	Y	Y
Automatic Soldering	N	Y	Y	Y
Automatic Washing	N	N	Y Note 1	Y Note 1
Manual Soldering	Y	Y	Y	—
Environmental Gas Resistance	N	N	Y Note 2	Y Note 2

Note 1. It is needed to select suitable washing solvent.

2. In explosive gas environment, use the metallic hermetic seal types.

High Reliability Supported by Uniques Technology

Deactivated Rhodium Contact:

OKI reed switches are highly reliable because rhodium is used as the contact material. Rhodium has two excellent features as the contact material: Extreme hardness, which improves the resistance against sticking; and a high melting point, which greatly reduces the contact surface consumption due to Joule heat or arc discharge affected by the current, and also improves the resistance against sticking. However, being a platinum metal, the surface of rhodium has active absorption and catalytic actions. Rhodium plating greatly absorbs organic impurities and forms a polymer in the course of operation, increasing contact resistance as shown in Fig. 21. This is especially noticeable a lower load level operation. OKI has developed a unique oxygen treatment method to deactivate the rhodium surface, in which organic impurities adhered to the surface are burned with oxygen and oxygen molecules are selectively absorbed to

produce a stabilized contact resistance. This unique method won the highest prize (Schneider Award) on the occasion of the 21st Annual National Relay Conference held in Oklahoma, U.S.A. in 1973. Patents have been obtained not only in Japan (Pat. No. 916386) but also in U.S.A. (Pat. No. 3857175) and West Germany (Pat. No. 2303587).

Automatic Sealing:

Sealing, the moment when a pressed and plated reed contact and a glass tube are united to form a reed switch, is the most important stage in the manufacturing process requiring strict control of conditions. At this stage, the working temperature reaches approx. 1,000°C causing evaporation of impurities from the glass tube and contamination and damage of the contact part of the reed switch. To prevent this, OKI has imposed severe standards on the selection of materials, and established a unique automatic

sealing method. By thus improving the manufacturing process, OKI is able to produce reed switches of the highest quality.

Flux Scanning Method:

In spite of severe control of the sealing process, there is a slight probability that foreign matter such as magnetic particles may enter the glass. After extensive study in the detection of micro impurities, OKI has adopted the highly reliable flux scanning method. In flux scanning, as shown in Fig. 22, external magnetism is moved so that foreign matter near the reed is forced to jump to the contact part. The contact resistance then measured is used as the standard for the selection of characteristics. We have thus succeeded in remarkably improving the reliability of reed switches by replacing conventional visual checking with the latest flux scanning method.

Notes:

- 1 Pull-in & drop-out were measured by using OKI standard coil. * This value of drop-out is prescribed when pull-in is over 20AT. When pull-in is less than 20AT, drop-out are 5 MIN & RLS/OP > 0.7. Tolerance at measurement is ± 2 AT. (Fig.1)
- 2 Measurements are made by the four-terminal voltage reduction method where the 100AT excitation is given to the switch using the OKI standard coil to close the contacts, and 10 mA current is applied.
- 3 This value varies depending on the pull-in value (contact gap). In this measurement, the pull-in value is about 20AT. (MIL-STD-202D METHOD 301)
- 4 Measurement is made by using a DC 100 V super megger. (MIL-STD-202D METHOD 302)
- 5 The values show those at MHz.
- 6 The value is obtained from the dry test under continuous current flow.
- 7 The value shows the time required for the contacts to cause the first contact bounce after applying the voltage to the OKI standard test coil. The time is shown at Top in Fig. 2

- 8 Bouncing is caused when the contact close. Bounce time means the time when opening and closing of the contacts are being repeated before the contacts are completely closed. Shown by T bounce.
- 9 Release time means the time from the moment the voltage applied to the test coil as removed to the moment the contacts open. Shown by Tris.
- 10 Resonant frequency is a vibrating frequency inherent to the reed switch. Avoid application of vibration at this frequency to the switch, otherwise it will cause misoperation.
- 11 The reed switch can be operated with a frequency higher than the maximum operating frequency. However, operation with such a frequency will often cause an endless chattering at the time of ON operation. It is recommended for the designer to take the maximum operating frequency into consideration when designing systems and circuits.
- 12 Dimensions of standard coil.
A: Inner diameter of standard coil.
B: Length of standard coil.

Fig. 2

13 If a shock of more than 30G is applied to a reed switch, the pull-in value of the switch will be often caused to change from the standard specification. Therefore, it is recommended not to use the reed switch which has been given such a shock.

14 If a vibration of more than 1 kHz is applied to a reed switch, even a very small acceleration to it will easily cause the switch to misoperate to close due to its resonant frequency.

15 In practice the reed switch can operate beyond the specified range. In case of magnet driving, however, some magnets show decrease of magnetic flux even at the lowest temperature of the range depending on their temperature characteristics. Therefore, it is recommended to consider the range as a general guide line.

16 The actual tensile strength is more than 5 kg (breakdown). However, considering the lead not to get out of position, the value for the static load is shown here.

Test Procedure (2) for operate, release and bounce time

Environmental Characteristics Table 2

	Characteristics (Common to All Types)	Test Conditions	Notes
Shock	Shall not misoperate with shock of 30G (11 msec) applied	MIL-STD-202E METHOD 213B	13
