- Power Saving CMOS Technology
- Very High-Speed SNAP! Pulse Programming
- 3-State Output Buffers
- 400-mV Minimum DC Noise Immunity With Standard TTL Loads
- Latchup Immunity of 250 mA on All Input and Output Lines
- Low Power Dissipation ( $V_{CC} = 5.5\text{ V}$ )
  - Active . . . 165 mW Worst Case
  - Standby . . . 1.4 mW Worst Case (CMOS Input Levels)
- Temperature Range Options
- 256K EPROM Available With MIL-STD-883C Class B High Reliability Processing (SMJ27C256)

## description

The TMS27C256 series are 32768 by 8-bit (262144-bit), ultraviolet (UV) light erasable, electrically programmable read-only memories (EPROMs).

The TMS27PC256 series are 32768 by 8-bit (262144-bit), one-time programmable (OTP) electrically programmable read-only memories (PROMs).

# TMS27C256 32768 BY 8-BIT UV ERASABLE TMS27PC256 32768 BY 8-BIT PROGRAMMABLE READ-ONLY MEMORIES

SMLS256H– SEPTEMBER 1984 – REVISED NOVEMBER 1997

## description (continued)

These devices are fabricated using power-saving CMOS technology for high speed and simple interface with MOS and bipolar circuits. All inputs (including program data inputs) can be driven by Series 74 TTL circuits without the use of external pull-up resistors. Each output can drive one Series 74 TTL circuit without external resistors.

The data outputs are 3-state for connecting multiple devices to a common bus. The TMS27C256 and the TMS27PC256 are pin compatible with 28-pin 256K MOS ROMs, PROMs, and EPROMs.

The TMS27C256 EPROM is offered in a dual-in-line ceramic package (J suffix) designed for insertion in mounting-hole rows on 15,2-mm (600-mil) centers. The TMS27PC256 OTP PROM is supplied in a 32-lead plastic leaded chip-carrier package using 1,25-mm (50-mil) lead spacing (FM suffix).

The TMS27C256 and TMS27PC256 are offered with two choices of temperature ranges of 0°C to 70°C (JL and FML suffixes) and – 40°C to 85°C (JE and FME suffixes). See Table 1.

All package styles conform to JEDEC standards.

**Table 1. Temperature Range Suffixes**

| EPROM<br>AND<br>OTP PROM | SUFFIX FOR OPERATING<br>FREE-AIR TEMPERATURE RANGES |                |
|--------------------------|-----------------------------------------------------|----------------|
|                          | 0°C TO 70°C                                         | – 40°C TO 85°C |
| TMS27C512-xxx            | JL                                                  | JE             |
| TMS27PC512-xxx           | FML                                                 | FME            |

These EPROMs and OTP PROMs operate from a single 5-V supply (in the read mode), thus are ideal for use in microprocessor-based systems. One other 13-V supply is needed for programming. All programming signals are TTL level. These devices are programmable by the SNAP! Pulse programming algorithm. The SNAP! Pulse programming algorithm uses a  $V_{PP}$  of 13 V and a  $V_{CC}$  of 6.5 V for a nominal programming time of four seconds. For programming outside the system, existing EPROM programmers can be used. Locations can be programmed singly, in blocks, or at random.

## operation

The seven modes of operation are listed in Table 2. The read mode requires a single 5-V supply. All inputs are TTL level except for  $V_{PP}$  during programming (13 V for SNAP! Pulse), and 12 V on A9 for the signature mode.

**Table 2. Operation Modes**

| FUNCTION       | MODE <sup>†</sup> |                |          |             |          |                 |                                   |

<sup>†</sup> X can be  $V_{IL}$  or  $V_{IH}$ .

<sup>‡</sup>  $V_H = 12\text{ V} \pm 0.5\text{ V}$ .

## read/output disable

When the outputs of two or more TMS27C256s or TMS27PC256s are connected in parallel on the same bus, the output of any particular device in the circuit can be read with no interference from the competing outputs of the other devices. To read the output of a single device, a low-level signal is applied to the  $\overline{E}$  and  $\overline{G}$  pins. All other devices in the circuit should have their outputs disabled by applying a high-level signal to one of these pins. Output data is accessed at pins DQ0 through DQ7.

## latchup immunity

Latchup immunity on the TMS27C256 and TMS27PC256 is a minimum of 250 mA on all inputs and outputs. This feature provides latchup immunity beyond any potential transients at the P.C. board level when the devices are interfaced to industry-standard TTL or MOS logic devices. Input-output layout approach controls latchup without compromising performance or packing density.

## power down

Active  $I_{CC}$  supply current can be reduced from 30 mA to 500  $\mu\text{A}$  (TTL-level inputs) or 250  $\mu\text{A}$  (CMOS-level inputs) by applying a high TTL or CMOS signal to the  $\overline{E}$  pin. In this mode all outputs are in the high-impedance state.

## erasure (TMS27C256)

Before programming, the TMS27C256 EPROM is erased by exposing the chip through the transparent lid to a high intensity ultraviolet light (wavelength 2537 Å). EPROM erasure before programming is necessary to assure that all bits are in the logic high state. Logic lows are programmed into the desired locations. A programmed logic low can be erased only by ultraviolet light. The recommended minimum exposure dose (UV intensity  $\times$  exposure time) is 15-W•s/cm<sup>2</sup>. A typical 12-mW/cm<sup>2</sup>, filterless UV lamp erases the device in 21 minutes. The lamp should be located about 2.5 cm above the chip during erasure. It should be noted that normal ambient light contains the correct wavelength for erasure. Therefore, when using the TMS27C256, the window should be covered with an opaque label.

# TMS27C256 32768 BY 8-BIT UV ERASABLE TMS27PC256 32768 BY 8-BIT PROGRAMMABLE READ-ONLY MEMORIES

SMLS256H– SEPTEMBER 1984 – REVISED NOVEMBER 1997

## initializing (TMS27PC256)

The one-time programmable TMS27PC256 PROM is provided with all bits in the logic high state, then logic lows are programmed into the desired locations. Logic lows programmed into an OTP PROM cannot be erased.

## SNAP! Pulse programming

The 256K EPROM and OTP PROM are programmed using the TI SNAP! Pulse programming algorithm illustrated by the flowchart in Figure 1, which programs in a nominal time of four seconds. Actual programming time varies as a function of the programmer used.

Data is presented in parallel (eight bits) on pins DQ0 to DQ7. Once addresses and data are stable,  $\overline{E}$  is pulsed.

The SNAP! Pulse programming algorithm uses initial pulses of 100 microseconds ( $\mu$ s) followed by a byte verification to determine when the addressed byte has been successfully programmed. Up to 10 (ten) 100- $\mu$ s pulses per byte are provided before a failure is recognized.

The programming mode is achieved when  $V_{PP} = 13$  V,  $V_{CC} = 6.5$  V,  $\overline{G} = V_{IH}$ , and  $\overline{E} = V_{IL}$ . More than one device can be programmed when the devices are connected in parallel. Locations can be programmed in any order. When the SNAP! Pulse programming routine is complete, all bits are verified with  $V_{CC} = V_{PP} = 5$  V.

## program inhibit

Programming can be inhibited by maintaining a high level input on the  $\overline{E}$  pin.

## program verify

Programmed bits can be verified with  $V_{PP} = 13$  V when  $\overline{G} = V_{IL}$  and  $\overline{E} = V_{IH}$ .

## signature mode

The signature mode provides access to a binary code identifying the manufacturer and type. This mode is activated when A9 is forced to 12 V. Two identifier bytes are accessed by toggling A0. All other addresses must be held low. The signature code for these devices is 9704. A0 selects the manufacturer's code 97 (Hex), and A0 high selects the device code 04, as shown in Table 3.

**Table 3. Signature Mode**

| IDENTIFIER <sup>†</sup> | PINS     |     |     |     |     |     |     |     |     |     |
|-------------------------|----------|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|                         | A0       | DQ7 | DQ6 | DQ5 | DQ4 | DQ3 | DQ2 | DQ1 | DQ0 | HEX |
| MANUFACTURER CODE       | $V_{IL}$ | 1   | 0   | 0   | 1   | 0   | 1   | 1   | 1   | 97  |
| DEVICE CODE             | $V_{IH}$ | 0   | 0   | 0   | 0   | 0   | 1   | 0   | 0   | 04  |

<sup>†</sup>  $\overline{E} = \overline{G} = V_{IL}$ , A9 =  $V_{IH}$ , A1–A8 =  $V_{IL}$ , A10–A15 =  $V_{IL}$ ,  $V_{PP} = V_{CC}$ ,  $\overline{PGM} = V_{IH}$  or  $V_{IL}$ .

<sup>†</sup> Value calculated from 0.5 V delta to measured level. This parameter is only sampled and not 100% tested.

NOTES: 3. For all switching characteristics the input pulse levels are 0.4 V to 2.4 V. Timing measurements are made at 2 V for logic high and 0.8 V for logic low) (see Figure 2).

4. Common test conditions apply for the  $t_{dis}$  except during programming.

## switching characteristics for programming: $V_{CC} = 6.50$ V and $V_{PP} = 13$ V (SNAP! Pulse), $T_A = 25^\circ\text{C}$ (see Note 3)

## PARAMETER MEASUREMENT INFORMATION

NOTE A:  $C_L$  includes probe and fixture capacitance.

### ac testing input/output wave forms

AC testing inputs are driven at 2.4 V for logic high and 0.4 V for logic low. Timing measurements are made at 2 V for logic high and 0.8 V for logic low for both inputs and outputs.

## **IMPORTANT NOTICE**

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
