

FAN7311B

LCD Backlight Inverter Drive IC

Features

- High-Efficiency Single-Stage Power Conversion
- Wide Input Voltage Range: 5V to 25.5V
- Backlight Lamp Ballast and Soft Dimming
- Reduced Number of Required External Components
- Precision Voltage Reference Trimmed to 2%
- ZVS Full-Bridge Topology
- Soft-Start Capability
- PWM Control at Fixed Frequency
- Analog and Burst Dimming Function
- Programmable Striking Frequency
- Open-Lamp Protection
- Open-Lamp Regulation
- 20-Pin SOIC

Applications

- LCD TV
- LCD Monitor

Description

The FAN7311B provides all the control functions for a series parallel resonant converter as well as a pulse width modulation (PWM) controller to develop a supply voltage. Typical operating frequency range is between 30kHz and 250kHz, depending on the cold cathode fluorescent lamp (CCFL) and the transformer's characteristics. The FAN7311B uses a new patent-pending phase-shift control.

20-SOIC

Ordering Information

Part Number	Package	Pb-Free	Operating Temperature Range	Packing Method
FAN7311BM	20-SOIC	Yes	-25°C to 85°C	Rail
FAN7311BMX	20-SOIC	Yes		Tape & Reel

Protected by U.S. Patent: 5,652,479; 7,158,390.

Pin Definitions

Pin #	Name	Description	Pin #	Name	Description
1	OLP	Open-Lamp Protection	11	BCT	Burst Dimming Timing Capacitor
2	OLR	Open-Lamp Regulation	12	RT	Timing Resistor
3	ENA	Enable Input	13	CT	Timing Capacitor
4	S_S	Soft-Start	14	OUTD	NMOSFET Drive Output D
5	GND	Analog Ground	15	OUTC	PMOSFET Drive Output C
6	REF	2.5V Reference Voltage	16	PGND	Power Ground
7	ADIM	Analog Dimming Input	17	V _{IN}	Supply Voltage
8	BDIM	Burst Dimming Input	18	OUTA	PMOSFET Drive Output A
9	EA_IN	Error Amplifier Input	19	OUTB	NMOSFET Drive Output B
10	EA_OUT	Error Amplifier Output	20	RT1	Striking Frequency Resistor

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

For typical values, $T_A=25^{\circ}\text{C}$ and $V_{IN}=12\text{V}$. For min. and max. values, T_A is the operating ambient temperature range with $-25^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$ and $5\text{V} \leq V_{IN} \leq 25.5\text{V}$, unless otherwise specified.

Symbol	Parameter	Value	Unit
V_{IN}	Supply Voltage	5 to 25.5	V
T_A	Operating Temperature Range	-25 to 85	$^{\circ}\text{C}$
T_J	Junction Temperature	150	$^{\circ}\text{C}$
T_{STG}	Storage Temperature Range	-65 to 150	$^{\circ}\text{C}$
$\theta_{JA}^{(1)}$	Thermal Resistance Junction-to-Ambient (still air)	70	$^{\circ}\text{C/W}$
P_D	Power Dissipation	1.8	W

Notes:

1. Thermal resistance test board size: 76.2 * 114.3 * 1.6mm (1S0P). JEDEC standard: JESD51-2, JESD51-3.

Electrical Characteristics

For typical values, $T_A = 25^\circ\text{C}$ and $V_{IN} = 12\text{V}$. For min. and max. values, T_A is the operating ambient temperature range with $-25^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$ and $5\text{V} \leq V_{IN} \leq 25.5\text{V}$, unless otherwise specified. Specifications from -25°C to 85°C are guaranteed by design based on final characterization results.

Note:

3. These parameters, although guaranteed, are not 100% tested in production.

Function Description

UVLO: The under-voltage lockout circuit guarantees stable operation of the IC's control circuit by stopping and starting it as a function of the V_{IN} value. The UVLO circuit turns on the control circuit when V_{IN} exceeds 5V. When V_{IN} is lower than 5V, the IC's standby current is less than 200 μ A.

ENA: Applying voltage higher than 2V to the ENA pin enables operation of the IC. Applying voltage lower than 0.7V to the ENA pin disables operation of the inverter.

Soft-Start: The soft-start function requires that the S_S pin is connected through a capacitor to GND. A soft-start circuit ensures a gradual increase in the input and output power. The capacitor connected to the S_S pin determines the rate at which the duty ratio rises. It is charged by a 6 μ A current source.

Figure 3. Soft-Start During Initial Operation

Main Oscillator: The timing capacitors (CTs) are charged by the reference current source, which is formed by the timing resistor (RT). The timing resistor's voltage is regulated at 1.25V. The sawtooth waveform charges up to 2V. Once this voltage is reached, the capacitors begin discharging down to 0.5V. Next, the timing capacitors start charging again and a new switching cycle begins. The main frequency can be programmed by adjusting the RT and CT values. The main frequency can be calculated as shown below.

$$f_{op} = \frac{19}{32 \cdot RT \cdot CT} \quad (1)$$

Figure 4. Main Oscillator Waveform

Burst Oscillator & Burst Dimming: The timing capacitors (BCTs) are charged by the reference current source, which is formed by the timing resistor (RT). The timing resistor's voltage is regulated at 1.25V. The sawtooth waveform charges up to 2V. Once this voltage is reached, the capacitors begin discharging down to 0.5V. Next, the timing capacitors start charging again and a new switching cycle begins. The burst dimming frequency can be programmed by adjusting the RT and BCT values. The burst dimming frequency can be calculated as shown in Equation 2.

$$f_{burst} = \frac{3.75}{96 \cdot RT \cdot CT} \quad (2)$$

To avoid visible flicker, the burst dimming frequency should be greater than 120Hz.

By comparing the input of BDIM pin with the 0.5~2V triangular wave of the burst oscillator, the PWM pulses for burst dimming. The PWM pulse controls EA_OUT's voltage by summing 85 μ A into the EA_IN pin.

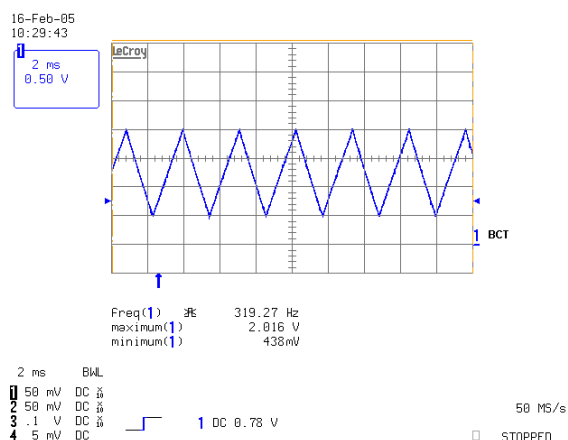

Figure 5. Burst Oscillator Waveform

Figure 6. Burst Dimming

Open Lamp Regulation and Open-Lamp Protection: It is necessary to suspend power stage operation if an open lamp occurs because the power stage has high gain. When a voltage higher than 2V is applied to the OLR pin, the part enters regulation mode and controls the EA_OUT voltage. This limits the lamp voltage by summing 105 μ A into the feedback node. At the same time, the OLP capacitor, connected to the OLP pin, is charged by the 1.4 μ A internal current source. Once it reaches 2.5V, the IC enters shutdown where all output is high.

Figure 7. OLR Voltage During Striking Mode

Output Drives: The four output drives are designed so that switches A and B, C and D never turn on simultaneously. The OUTA-OUTB pair is intended to drive one half-bridge in the external power stage. The OUTC-OUTD pair drives the other half-bridge.

Figure 8. Phase-Shift Control Waveforms

Timing Diagram

The FAN7311B uses the improved phase-shift control full-bridge to drive CCFL. As a result, the temperature difference between the left and the right leg is almost zero. The detail timing is shown below.

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.

2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
