- Fit and forget: millions of switching cycles
- Ideal for switching of single phase loads in residential buildings

Product Description

The RMD houses semiconductor thyristors and mechanical contacts that compliment each other. On applying the control voltage, thyristors are activated. After a short delay, an electromechanical relay is activated. This switching method protects the contacts of the electromechanical relay and reduces heating of the thyristors. The same principle applies during removal of the control input. The result is millions of trouble-free cycles in a compact and modular switching package.
