

# AK4121A

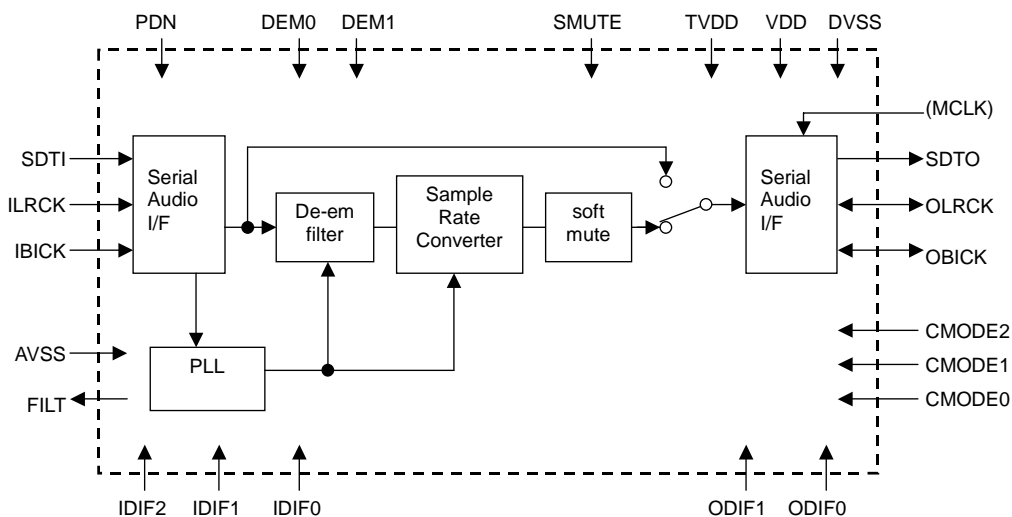

## Asynchronous Sample Rate Converter

### GENERAL DESCRIPTION

The AK4121A is a stereo asynchronous sample rate converter. The input sample rate ranges from 8kHz to 96kHz. The output sample rate is 32kHz, 44.1kHz, 48kHz or 96kHz. Since the internal PLL eliminates the need for a master clock in slave mode, the AK4121 simplifies the system design. Therefore, the AK4121A is suitable for applications requiring multiple sample rates, such as Car Audio, DVD recorders, and digital audio recording.

### FEATURES

- ☐ Stereo asynchronous sample rate converter
- ☐ Input sample rate range (FSI): 8kHz to 96kHz
- ☐ Output sample rate (FSO): 32kHz/44.1kHz/48kHz/96kHz
- ☐ Input to output Sample rate ratio: FSO/FSI = 0.33 to 6
- ☐ THD+N: -113dB
- ☐ I/F format: MSB justified, LSB justified (24/20/16bit) and I<sup>2</sup>S
- ☐ Clock for Master mode: 256/384/512/768fso
- ☐ De-emphasis filter: 32kHz/44.1kHz/48kHz
- ☐ SRC Bypass mode
- ☐ Soft Mute function
- ☐ Power Supply: VDD: 3.0 to 3.6V, TVDD: 3.0 to 5.5V (for input tolerant)
- ☐ Ta: -40 to +85°C

## ■ Ordering Guide

AK4121AVF	−40 ~ +85°C	24pin VSOP (0.65mm pitch)
AKD4121A	Evaluation Board for AK4121A	

## ■ Pin Layout

## ■ Difference between AK4121 and AK4121A

The AK4121A has a better performance than the AK4121 regarding of the tracking capability to the change of the input sampling frequency (FSI) which normally takes long settling time. Refer to “Tracking to the Input Sampling Frequency”.

## PIN/FUNCTION

No.	Pin Name	I/O	Function
1	FILT	O	Loop-Filter Pin for PLL
2	AVSS	I	Analog Ground Pin
3	PDN	I	Power-Down pin When “L”, the AK4121A is powered-down and reset.
4	SMUTE	I	Soft Mute Pin
5	DEM0	I	De-emphasis Filter Control Pin #0
6	DEM1	I	De-emphasis Filter Control Pin #1
7	ILRCK	I	L/R Clock Pin for Input
8	IBICK	I	Audio Serial Data Clock Pin for Input
9	SDTI	I	Audio Serial Data Input Pin
10	IDIF0	I	Input Data Format pin #0
11	IDIF1	I	Input Data Format pin #1
12	IDIF2	I	Input Data Format pin #2
13	CMODE0	I	Clock Mode Select Pin #0
14	CMODE1	I	Clock Mode Select Pin #1
15	CMODE2	I	Clock Mode Select Pin #2
16	ODIF0	I	Output Data Format pin #0
17	ODIF1	I	Output Data Format pin #1
18	SDTO	O	Audio Serial Data Output Pin
19	OBICK	I/O	Audio Serial Data Clock Pin for Output
20	OLRCK	I/O	L/R Clock Pin for Output
21	MCLK	I	Master Clock Pin for Output
22	TVDD	I	Input Buffer Power Supply Pin, 3.3V or 5V
23	DVSS	I	Digital Ground Pin
24	VDD	I	Power Supply Pin, 3.3V

**ABSOLUTE MAXIMUM RATINGS**(AVSS=DVSS=0V; [Note 1](#))

Note 8. Min is 8kHz when BYPASS=“H”.

Note 9. BICK rising edge must not occur at the same time as LRCK edge.

Note 10. The AK4121A must be reset by bringing PDN pin “H” to “L” upon power-up.

■ Timing Diagram

Figure 1. Clock Timing

Figure 2. Audio Interface Timing at Slave Mode

Figure 3. Audio Interface Timing at Master Mode

Figure 4. Power-down &amp; Reset Timing

Note 11. BICK means IBICK and OBICK.

Note 12. LRCK means ILRCK and OLRCK.

## OPERATION OVERVIEW

### ■ System Clock

The input port works in slave mode only. The output port works in slave and master mode. An internal system clock is created by the internal PLL using ILRCK. The MCLK is not needed when the output port is in slave mode, and the MCLK pin should be connected to DVSS. The CMODE2-0 pins must be controlled when PDN pin = "L".

Mode	CMODE2	CMODE1	CMODE0	MCLK	Master/Slave (Output Port)
0	L	L	L	256fso (fso~96kHz)	Master
1	L	L	H	384fso (fso~96kHz)	Master
2	L	H	L	512fso (fso~48kHz)	Master
3	L	H	H	768fso (fso~48kHz)	Master
4	H	L	L	Not used. Set to DVSS	Slave
5	H	L	H	-	(Reserved)
6	H	H	L	-	(Reserved)
7	H	H	H	Not used. Set to DVSS	Master (BYPASS mode)

Table 1. Master/Slave control

### ■ Audio Interface Format

The IDIF2-0 pins select the data mode for the input port. The ODIF1-0 pins select the data mode for the output port. In all modes the audio data is MSB-first, 2's complement format. The SDTO is clocked out on the falling edge of OBICK. Select these modes when PDN pin="L". In BYPASS mode, both IBICK and OBICK are fixed to 64fs.

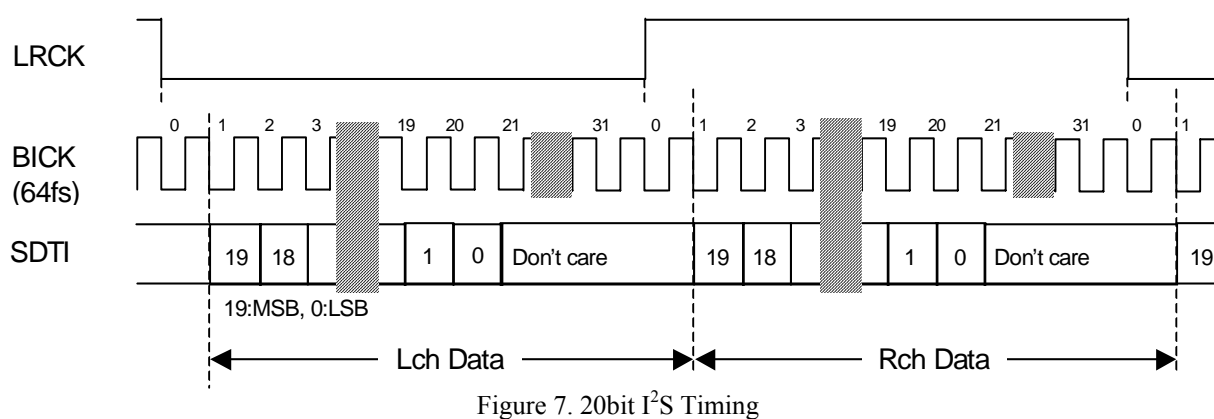

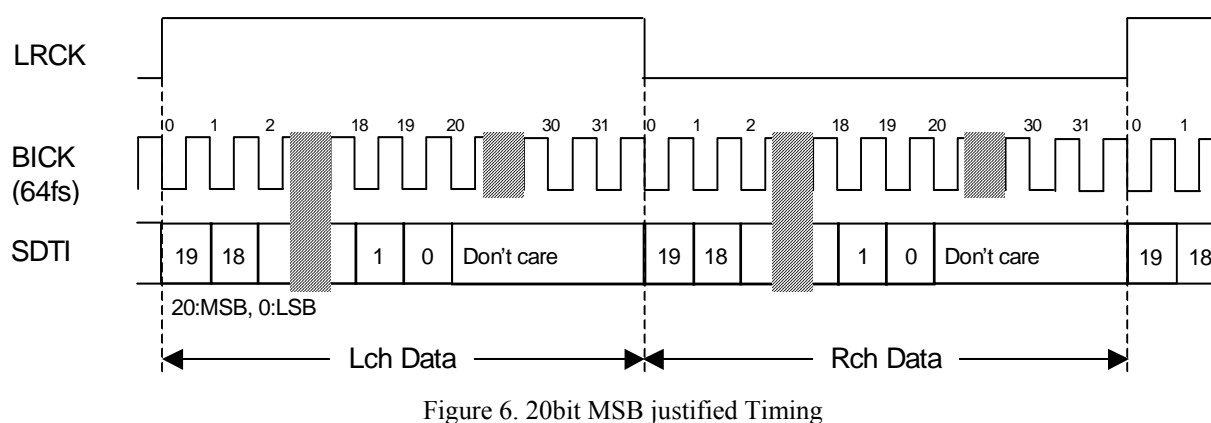

Mode	IDIF2	IDIF1	IDIF0	SDTI Format	IBICK (Slave)
0	L	L	L	16bit LSB Justified	≥32fs
1	L	L	H	20bit LSB Justified	≥40fs
2	L	H	L	20bit MSB Justified	≥40fs
3	L	H	H	20/16bit I <sup>2</sup> S Compatible	≥40fs or 32fs
4	H	L	L	24bit LSB Justified	≥48fs

Table 2. Input Audio Data Formats

Mode	ODIF1	ODIF0	SDTO Format	OBICK (Slave)	OBICK (Master)
0	L	L	16bit LSB Justified	64fs	64fs
1	L	H	20bit LSB Justified	64fs	64fs
2	H	L	20/16bit MSB Justified (Note 13)	≥40fs or 32fs	64fs
3	H	H	20/16bit I <sup>2</sup> S Compatible (Note 13)	≥40fs or 32fs	64fs

Note 13. The 16bit output is available only when the OBICK = 32fs.

Table 3. Output Audio Data Formats

## ■ Soft Mute Operation

When the SMUTE pin changes to “H”, the output signal is attenuated from 0dB to  $-\infty$ dB during 1024 OLRCK cycles. When the SMUTE pin returns to “L”, the attenuation is cancelled and the output signal gradually changes to 0dB during 1024 OLRCK cycles. If the soft mute is cancelled before attenuating to  $-\infty$ , the attenuation is discontinued and returns to 0dB by the same cycles. The soft mute is effective for changing the signal source.

Notes:

- (1) Transition time. 1024 OLRCK cycles ( $1024/f_{so}$ ).
- (2) If the soft mute is cancelled before attenuating to  $-\infty$  after starting the operation, the attenuation is discontinued and returned to 0dB by the same number of clock cycles.

Figure 8. Soft Mute

## ■ De-emphasis Filter

A digital de-emphasis filter is available for 32, 44.1 or 48kHz sampling rates ( $t_c=50/15\mu s$ ) and is enabled or disabled with DEM0 and DEM1.

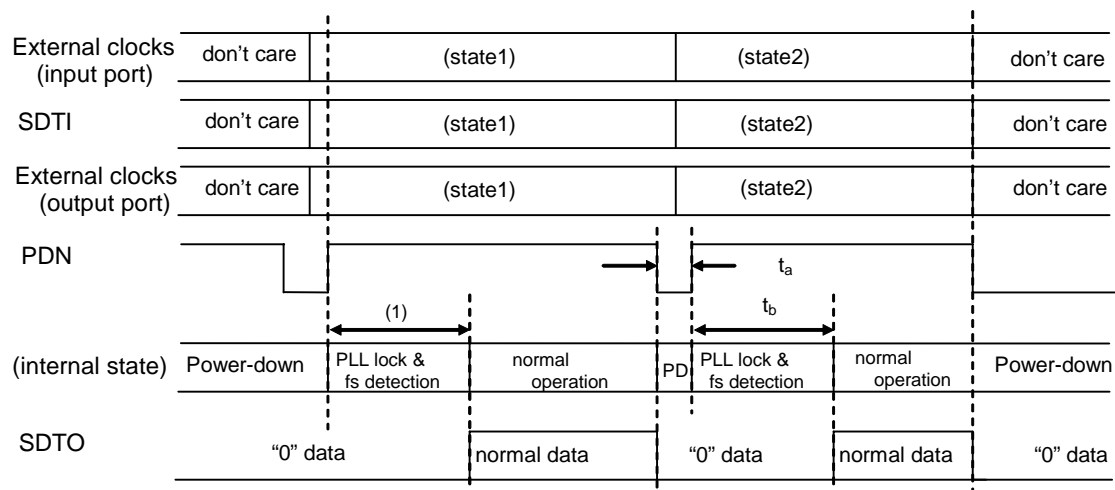

Mode	DEM1	DEM0	De-emphasis filter
0	L	L	44.1kHz
1	L	H	OFF
2	H	L	48kHz
3	H	H	32kHz

Table 4. De-emphasis Filter Control

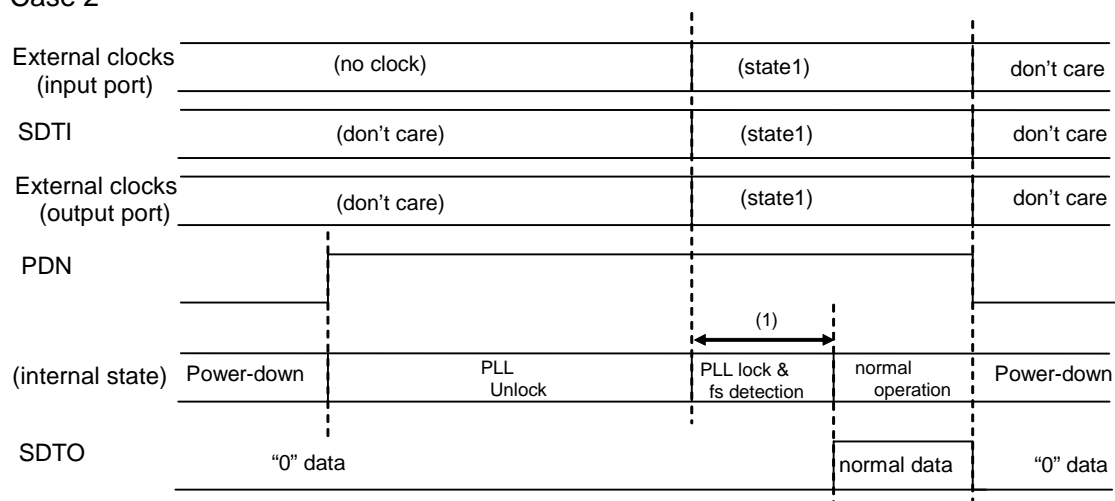

## ■ System Reset

Bringing the PDN pin="L" places the AK4121A in the power-down mode and initializes the digital filter. This reset should always be done after power-up. When the PDN pin = "L", the SDTO output is "L". Regarding the SDTO valid time, please refer to the [Table 5](#). Until the output data becomes valid, the SDTO pin outputs "L".

### Case 1

### Case 2

Note:

(1) <100ms for recommended value 2, <200ms for recommended value 1. ([Figure 11](#))

Figure 9. System Reset

Reset time $t_a$	Data valid time $t_b$
$\leq 10\text{ms}$	$< 100\text{ms}$
$10\text{ms} <$	$< 200\text{ms}$

Table 5. Reset time  $t_a$  and Data valid time  $t_b$ .

## ■ Internal Reset Function for Clock Change

The AK4121A is reset automatically when the output clock is stopped. If the output clock is started again, normal data is output within 100ms.

## ■ Sequence of changing clocks

The recommended sequence for changing clocks is shown in Figure 10.

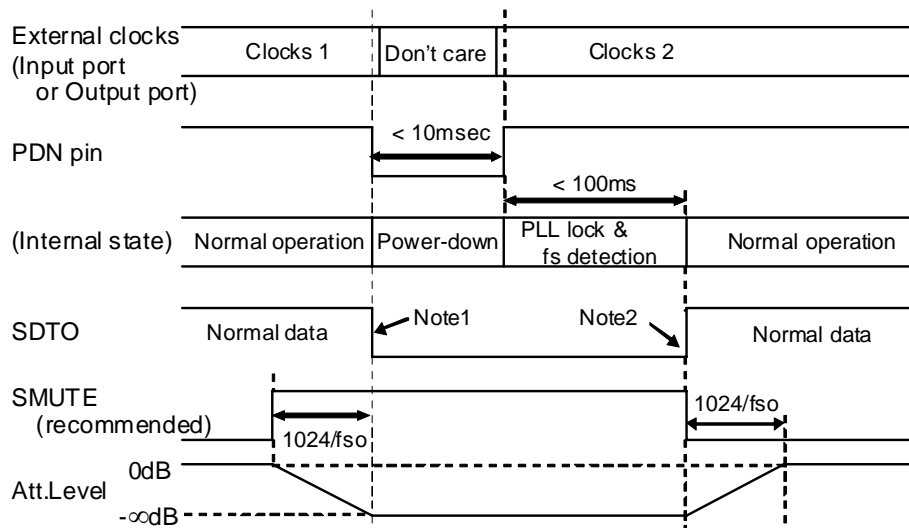

Figure 10. Sequence of changing clocks

Note 1. The data on SDTO may cause a clicking noise. To prevent this, set SDTI to “0” from GD before the PDN pin changes to “L”, which will cause the data on SDTO to remain “0”.

Note 2. The data on SDTO may cause a clicking noise. To prevent this, set SDTI to “0” for  $1024/f_{so} + 100\text{ms}$  or more from the timing PDN pin changes to “H” while the SMUTE pin = “H”.

Note 3. When the PDN pin is not used for this clock change, a distorted signal may output for about 10ms ~ 100ms (typ) after changing clocks.

## ■ Grounding and Power Supply Decoupling

The AK4121A requires careful attention to power supply and grounding arrangements. VDD are usually supplied from the system's analog supply. **AVSS and DVSS of the AK4121A must be connected to the analog ground plane.** System analog ground and digital ground should be connected together as close as possible to where the supplies are brought onto the printed circuit board. Decoupling capacitors especially a 0.1 $\mu$ F ceramic capacitor for high frequency noise should be placed as near to VDD as possible.

## ■ PLL Loop-Filter

The C1 (4.7 $\mu$ F) and R (560ohms) should be connected in series and attached between FILT pin and AVSS in parallel with C2 (1.0nF). A Care should be taken to ensure that noise on the FILT pin is minimized.

Parameter	Recommended value 1	Recommended value 2
R	560ohm $\pm$ 8%	1.2kohm $\pm$ 8%
C1	4.7 $\mu$ F $\pm$ 40%	2.2 $\mu$ F $\pm$ 40%
C2	1.0nF $\pm$ 40%	2.2nF $\pm$ 40%
FSI range	8k ~ 96kHz	16k ~ 96kHz

Note 14. Those recommended values include temperature dependence.

Figure 11. PLL Loop-Filter

## ■ Jitter Tolerance

Figure 12 shows the jitter tolerance to ILRCK. The jitter quantity is defined by the jitter frequency and the jitter amplitude shown in Figure 12. When the jitter amplitude is 0.01UIpp or less, the AK4121A operates normally regardless of the jitter frequency.

- (1) Normal operation
- (2) There is a possibility that the distortion degrades. (It may degrade up to about -50dB.)
- (3) There is a possibility that the output data is lost.

Note 15. The jitter amplitude for 1UI (Unit Interval) is one cycle of ILRCK. When FSI = 48kHz, 1UI is  $1/48\text{kHz} = 20.8\mu\text{s}$ .

Figure 12. Jitter Tolerance

## ■ Tracking to the Input Sampling Frequency

When the ILRCK is generated by an external PLL, it may take a time to settle after changing the input sampling frequency because the response of an external PLL to the frequency change is slow. In case of the AK4121, the output data becomes incorrect when the speed of the frequency change exceeds 0.14%/sec. The AK4121A operates normally up to 23%/sec speed and the output data becomes incorrect at the speed of the frequency change over 23%/sec.

## SYSTEM DESIGN

Figure 13 and Figure 14 illustrate typical system connection diagrams. The evaluation board [AKD4121A] demonstrates this application circuit, the optimum layout, and power supply arrangement and performance measurement results.

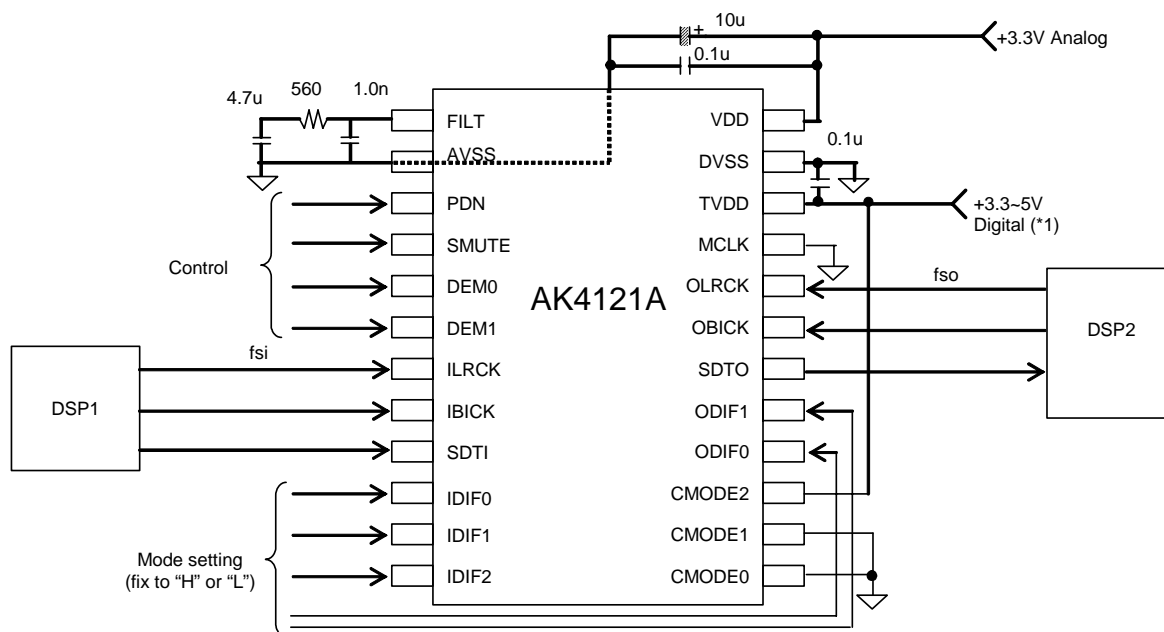

Figure 13. Example of a typical design (Slave Mode)

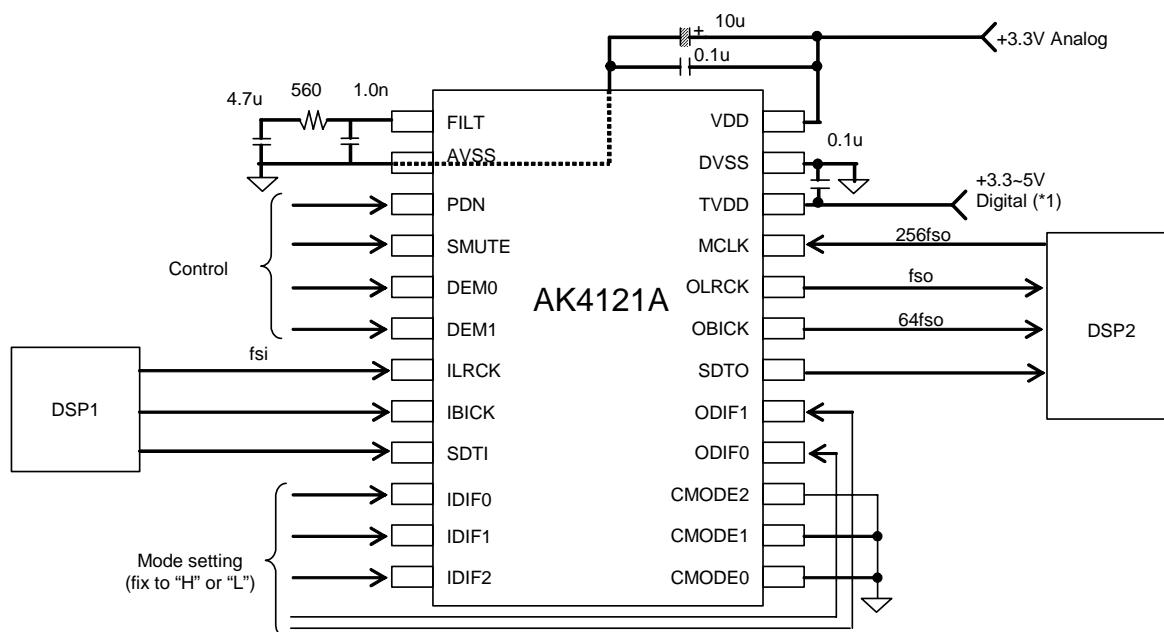

Figure 14. Example of a typical design (Master Mode; MCLK=256fso)

\*1. TVDD should be the same as the maximum input voltage.

## PACKAGE

## 24pin VSOP (Unit: mm)

NOTE: Dimension "\*" does not include mold flash.

### ■ Package & Lead frame material

Package molding compound:

Epoxy

Lead frame material:

Cu

Lead frame surface treatment:

Solder plate (Pb free)
