## description/ordering information

This 10-bit FET bus switch is designed for 3-V to 3.6-V $V_{CC}$ operation and SSTL_2 output-enable ($\overline{OE}$) input levels.

When $\overline{OE}$ is low, the 10-bit bus switch is on, and port A is connected to port B. When $\overline{OE}$ is high, the switch is open, and the high-impedance state exists between the two ports. There are 10-kΩ pulldown resistors to ground on the B port.

The FET switch on-state resistance is designed to replace the series terminating resistor in the SSTL_2 data path.

This device is fully specified for partial-power-down applications using $I_{off}$. The $I_{off}$ feature ensures that damaging current will not backflow through the device when it is powered down. The device has isolation during power off.

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
