Am26LS31

Quad High Speed Differential Line Driver

DISTINCTIVE CHARACTERISTICS

- Output skew – 2.0 ns typical
- Input to output delay – 12 ns
- Operation from single +5 V supply
- 16-pin hermetic and molded DIP package
- Outputs won't load line when $V_{CC} = 0$
- Four line drivers in one package for maximum package density
- Output short-circuit protection
- Complementary outputs
- Meets the requirements of EIA standard RS-422
- High output drive capability for 100 Ω terminated transmission lines
- Available in military and commercial temperature range
- Advanced low-power Schottky processing

GENERAL DESCRIPTION

The Am26LS31 is a quad-differential line driver, designed for digital data transmission over balanced lines. The Am26LS31 meets all the requirements of EIA standard RS-422 and federal standard 1020. It is designed to provide unipolar differential drive to twisted-pair or parallel-wire transmission lines.

The circuit provides an enable and disable function common to all four drivers. The Am26LS31 features

3-state outputs and logical OR-ed complementary enable inputs. The inputs are all LS compatible and are all one unit load.

The Am26LS31 is constructed using advanced low-power Schottky processing.

ORDERING INFORMATION**Standard Products**

AMD standard products are available in several packages and operating ranges. The order number (Valid Combination) is formed by a combination of:

Valid Combinations	
AM26LS31	PC, PCB DC, DCB SC

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations or to check on newly released combinations, and to obtain additional data on AMD's standard military grade products.

MILITARY ORDERING INFORMATION**SMD/DESC Products**

AMD products for Aerospace and Defense applications are available in several packages and operating ranges. Standard Military Drawing (SMD)/DESC products are fully compliant with MIL-STD-883C requirements. The order number (Valid Combination) is formed by a combination of:

Valid Combinations	
5962-7802301	MEA, MFA, M2A

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations, or to check on newly released combinations.

Group A Tests

Group A tests consist of Subgroups
1, 2, 3, 7, 8, 9, 10, 11.

MILITARY ORDERING INFORMATION**APL Products**

AMD products for Aerospace and Defense applications are available in several packages and operating ranges. APL (Approved Products List) products are fully compliant with MIL-STD-883C requirements. The order number (Valid Combination) is formed by a combination of:

Valid Combinations	
Am26LS31	/BEA, /BFA, /B2A

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations, or to check on newly released combinations.

Group A Tests

Group A tests consist of Subgroups
1, 2, 3, 7, 8, 9, 10, 11.

The diagram shows a differential signal conditioning circuit. It consists of four 1/4 Am26LS32 comparators. The first comparator (1/4 Am26LS31) takes the 'Data Input' and its output is connected to the non-inverting input (+) of the second comparator (1/4 Am26LS32). The second comparator's output is connected to the inverting input (-) of the third comparator (1/4 Am26LS32). The third comparator's output is connected to the non-inverting input (+) of the fourth comparator (1/4 Am26LS32). The fourth comparator's output is connected to the inverting input (-) of the second comparator. A feedback loop with a resistor R_f connects the output of the second comparator to the input of the first comparator. A resistor R_t is connected between the output of the second comparator and the 'Data Out' signal. The circuit is connected to a 'Shield or Common Ground Return'.

ABSOLUTE MAXIMUM RATINGS

Storage Temperature	-65 to +150°C
Supply Voltage	-0.5 to 7.0 V
DC Input Voltage	-1.5 to 7.0 V
DC Output Voltage	-0.5 to V _{CC} max

Stresses above those listed under Absolute Maximum Ratings may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

OPERATING RANGES**Commercial (C) Devices**

Ambient Temperature (T _A)	0 to +70°C
Supply Voltage (V _{CC})	+4.75 to +5.25 V

Military (M) Devices

Temperature	-55 to +125°C
Supply Voltage (V _{CC})	+4.5 to +5.5 V

Operating ranges define those limits between which the functionality of the device is guaranteed.

Notes:

1. All typical values are V_{CC} = 5.0 V, T_A = 25°C.
2. C_L = 30 pF, V_{IN} = 1.3 V to V_{OUT} = 1.3 V, V_{PULSE} = 0 V to +3.0 V, R_{L1} = 180 Ω, R_{L2} = 75 Ω.
3. Input thresholds are tested during DC tests and may be done in combination with testing of other DC parameters.
4. Not more than one output should be shorted at a time. Duration of the short circuit test should not exceed one second.
