SYNCHRONOUS DRAM MODULE

MT9LSDT1672A(I) – 128MB
MT18LSDT3272A(I) – 256MB

For the latest data sheet, please refer to the Micron® Web site: www.micron.com/products/modules

Features

- PC100- and PC133-compliant
- 168-pin, dual in-line memory module (DIMM)
- Unbuffered, ECC-optimized pinout
- 128MB (16 Meg x 72) and 256MB (32 Meg x 72)
- Single +3.3V power supply
- Fully synchronous; all signals registered on positive edge of system clock
- Internal pipelined operation; column address can be changed every clock cycle
- Internal SDRAM banks for hiding row access/precharge
- Programmable burst lengths: 1, 2, 4, 8, or full page
- Auto Precharge, includes Concurrent Auto Precharge, and Auto Refresh Modes
- Self Refresh Mode
- 64ms, 4,096-cycle refresh
- LVTTL-compatible inputs and outputs
- Serial Presence-Detect (SPD)
- Gold edge contacts

Table 6: Pin Descriptions

Pin numbers may not correlate with symbols. Refer to the Pin Assignment tables on page 3 for more information

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
27, 111, 115	RAS#, CAS#, WE#	Input	Command Inputs: RAS#, CAS#, and WE# (along with S#) define the command being entered.
42, 79, 125, 163	CK0–CK3	Input	Clock: CK is driven by the system clock. All SDRAM input signals are sampled on the positive edge of CK. CK also increments the internal burst counter and controls the output registers.
63, 128	CKE0, CKE1	Input	Clock Enable: CKE activates (HIGH) and deactivates (LOW) the CK signal. Deactivating the clock provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all device banks idle) or CLOCK SUSPEND OPERATION (burst access in progress). CKE is synchronous except after the device enters power-down and self refresh modes, where CKE becomes asynchronous until after exiting the same mode. The input buffers, including CK, are disabled during power-down and self refresh modes, providing low standby power.
30, 45,114, 129	S0#–S3#	Input	Chip Select: S# enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when S# is registered HIGH. S# is considered part of the command code.
28, 29, 46, 47, 112, 113, 130, 131	DQMB0–DQMB7	Input	Input/Output Mask: DQMB is an input mask signal for write accesses and an output enable signal for read accesses. Input data is masked when DQMB is sampled HIGH during a WRITE cycle. The output buffers are placed in a High-Z state (two-clock latency) when DQMB is sampled HIGH during a READ cycle.
39, 122	BA0, BA1	Input	Bank Address: BA0 and BA1 define to which device bank the ACTIVE, READ, WRITE, or PRECHARGE command is being applied.
33–38, 117–121, 123	A0–A11	Input	Address Inputs: Provide the row address for ACTIVE commands, and the column address and auto prcharge bit (A10) for READ/WRITE commands, to select one location out of the memory arrary in the respective device bank. A10 sampled during a PRECHARGE command determines whether the PRECHARGE applies to one device bank (A10 LOW, device bank selected by BA0, BA1) or all device banks (A10 HIGH). The address inputs also provide the op-code during a MODE REGISTER SET command.
83	SCL	Input	Serial Clock for Presence-Detect: SCL is used to synchronize the presence-detect data transfer to and from the module.
165–167	SA0–SA2	Input	Presence-Detect Address Inputs: These pins are used to configure the presence-detect device.
21, 22, 52, 53, 105, 106, 136, 137	CB0–CB7	Input/ Output	Check Bits. ECC, 1-bit error detection and correction.
2–5, 7–11, 13–17, 19, 20, 55–58, 60, 65–67, 69–72, 74–77, 86–89, 91–95, 97–101, 103, 104, 139–142, 144, 149–151, 153–156,158–161	DQ0–DQ63	Input/ Output	Data I/O: Data bus.
82	SDA	Input/ Output	Serial Presence-Detect Data: SDA is a bidirectional pin used to transfer addresses and data into and out of the presence-detect portion of the module.

Table 6: Pin Descriptions

Pin numbers may not correlate with symbols. Refer to the Pin Assignment tables on page 3 for more information

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
6, 18, 26, 40, 41, 49, 59, 73, 84, 90, 102, 110, 124, 133, 143, 157, 168	V_{DD}	Supply	Power Supply: +3.3V ±0.3V.
1, 12, 23, 32, 43, 54, 64, 68, 78, 85, 96, 107, 116, 127, 138, 148, 152, 162	V_{SS}	Supply	Ground.
24, 25, 31, 44, 48, 50, 51 61, 62, 80, 81, 108, 109, 126, 132, 134, 135, 145,146, 147	NC	–	Not Connected: These pins are not connected on these module.

Standard modules use the following SDRAM devices:
MT48LC16M8A2TG

Lead-free modules use the following SDRAM devices:
MT48LC16M8A2TG

General Description

The MT9LSDT1672 and MT18LSDT3272A modules are high-speed CMOS, dynamic random-access, 128MB and 256MB DIMMs organized in a x72 (ECC) configuration. SDRAM modules use internally configured quad-bank SDRAM devices with a synchronous interface (all signals are registered on the positive edge of the clock signals).

Read and write accesses to the SDRAM modules are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an ACTIVE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVE command are used to select the device bank and row to be accessed (BA0, BA1 select the device bank, A0–A11 select the device row). The address bits registered coincident with the READ or WRITE command are used to select the starting column location for the burst access.

SDRAM modules provide for programmable READ or WRITE burst lengths of 1, 2, 4, or 8 locations, or the full page, with a burst terminate option. An AUTO PRECHARGE function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst sequence.

SDRAM modules use an internal pipelined architecture to achieve high-speed operation. This architecture is compatible with the 2*n* rule of prefetch architectures, but it also allows the column address to be changed on every clock cycle to achieve a high-speed, fully random access. Precharging one device bank while accessing one of the other three device banks will hide the precharge cycles and provide seamless, high-speed, random-access operation.

SDRAM modules are designed to operate in 3.3V, low-power memory systems. An auto refresh mode is provided, along with a power-saving, power-down mode. All inputs and outputs are LVTTL-compatible.

SDRAM modules offer substantial advances in DRAM operating performance, including the ability to syn-chronously burst data at a high data rate with automatic column-address generation, the ability to interleave between internal device banks in order to hide precharge time and the capability to randomly change column addresses on each clock cycle during a burst access. For more information regarding SDRAM operation, refer to the 128Mb SDRAM component data sheet.

Serial Presence-Detect Operation

These modules incorporate serial presence-detect (SPD). The SPD function is implemented using a 2,048-bit EEPROM. This nonvolatile storage device contains 256 bytes. The first 128 bytes can be programmed by Micron to identify the module type and various SDRAM organizations and timing parameters. The remaining 128 bytes of storage are available for use by the customer. System READ/WRITE operations between the master (system logic) and the slave EEPROM device (DIMM) occur via a standard I^2C bus using the DIMM's SCL (clock) and SDA (data) signals, together with SA (2:0), which provide eight unique DIMM/EEPROM addresses. Write protect (WP) is tied to ground on the module, permanently disabling hardware write protect.

Initialization

SDRAMs must be powered up and initialized in a predefined manner. Operational procedures other than those specified may result in undefined operation. Once power is applied to V_{DD} and $V_{DD}Q$ (simultaneously) and the clock is stable (stable clock is defined as a signal cycling within timing constraints specified for the clock pin), the SDRAM requires a 100µs delay prior to issuing any command other than a COMMAND INHIBIT or NOP. Starting at some point during this 100µs period and continuing at least through the end of this period, COMMAND INHIBIT or NOP commands should be applied.

Once the 100µs delay has been satisfied with at least one COMMAND INHIBIT or NOP command having been applied, a PRECHARGE command should be applied. All device banks must then be precharged, thereby placing the device in the all banks idle state.

Once in the idle state, two AUTO REFRESH cycles must be performed. After the AUTO REFRESH cycles are complete, the SDRAM is ready for mode register programming. Because the mode register will power up in an unknown state, it should be loaded prior to applying any operational command.

Mode Register Definition

The mode register is used to define the specific mode of operation of the SDRAM. This definition includes the selection of a burst length, a burst type, a CAS latency, an operating mode and a write burst mode, as shown in Figure 5, Mode Register Definition Diagram, on page 9. The mode register is programmed via the LOAD MODE REGISTER command and will retain the stored information until it is programmed again or the device loses power.

Mode register bits M0–M2 specify the burst length, M3 specifies the type of burst (sequential or interleaved), M4–M6 specify the CAS latency, M7 and M8 specify the operating mode, M9 specifies the write

burst mode, and M10 and M11 are reserved for future use. Address A12 (M12) is undefined but should be driven LOW during loading of the mode register.

The mode register must be loaded when all device banks are idle, and the controller must wait the specified time before initiating the subsequent operation. Violating either of these requirements will result in unspecified operation.

Burst Length

Read and write accesses to the SDRAM are burst oriented, with the burst length being programmable, as shown in Figure 5, Mode Register Definition Diagram, on page 9. The burst length determines the maximum number of column locations that can be accessed for a given READ or WRITE command. Burst lengths of 1, 2, 4, or 8 locations are available for both the sequential and the interleaved burst types, and a full-page burst is available for the sequential type. The full-page burst is used in conjunction with the BURST TERMINATE command to generate arbitrary burst lengths.

Reserved states should not be used, as unknown operation or incompatibility with future versions may result.

When a READ or WRITE command is issued, a block of columns equal to the burst length is effectively selected. All accesses for that burst take place within this block, meaning that the burst will wrap within the block if a boundary is reached, as shown in Table 7, Burst Definition Table, on page 10. The block is uniquely selected by A1–A9 when the burst length is set to two; by A2–A9 when the burst length is set to four; and by A3–A9 when the burst length is set to eight. The remaining (least significant) address bit(s) is (are) used to select the starting location within the block. Full-page bursts wrap within the page if the boundary is reached, as shown in Table 7, Burst Definition Table, on page 10.

Burst Type

Accesses within a given burst may be programmed to be either sequential or interleaved; this is referred to as the burst type and is selected via bit M3.

The ordering of accesses within a burst is determined by the burst length, the burst type and the starting column address, as shown in Table 7, Burst Definition Table, on page 10.

Figure 5: Mode Register Definition Diagram

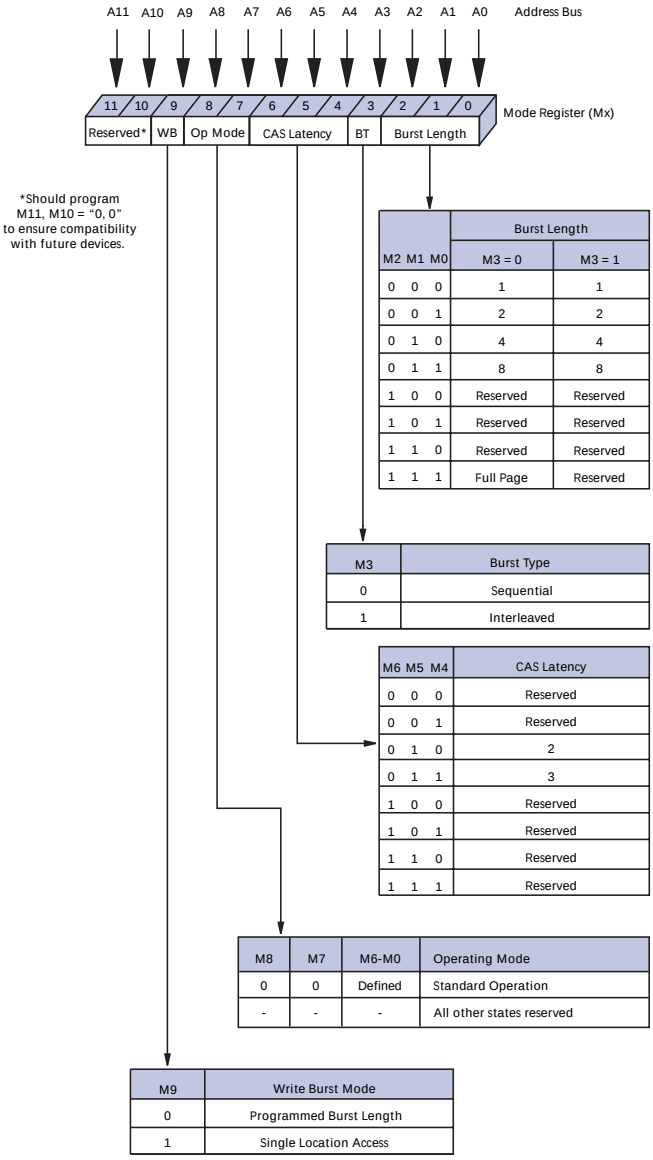

Table 7: Burst Definition Table

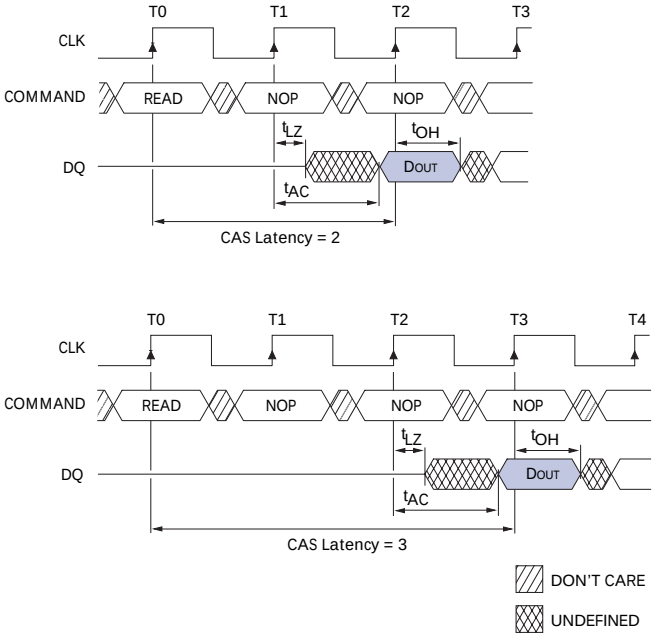
BURST LENGTH	STARTING COLUMN ADDRESS			ORDER OF ACCESSES WITHIN A BURST	
				TYPE = SEQUENTIAL	TYPE = INTERLEAVED
2			A0		
			0	0-1	0-1
			1	1-0	1-0
4		A1	A0		
		0	0	0-1-2-3	0-1-2-3
		0	1	1-2-3-0	1-0-3-2
		1	0	2-3-0-1	2-3-0-1
		1	1	3-0-1-2	3-2-1-0
8	A2	A1	A0		
	0	0	0	0-1-2-3-4-5-6-7	0-1-2-3-4-5-6-7
	0	0	1	1-2-3-4-5-6-7-0	1-0-3-2-5-4-7-6
	0	1	0	2-3-4-5-6-7-0-1	2-3-0-1-6-7-4-5
	0	1	1	3-4-5-6-7-0-1-2	3-2-1-0-7-6-5-4
	1	0	0	4-5-6-7-0-1-2-3	4-5-6-7-0-1-2-3
	1	0	1	5-6-7-0-1-2-3-4	5-4-7-6-1-0-3-2
	1	1	0	6-7-0-1-2-3-4-5	6-7-4-5-2-3-0-1
	1	1	1	7-0-1-2-3-4-5-6	7-6-5-4-3-2-1-0
Full Page (y)	n= A0-A9 (location 0-y)			Cn, Cn+1, Cn+2 Cn+3, Cn+4... ...Cn-1, Cn...	Not Supported

NOTE:

1. For full-page accesses: y = 1,024
2. For a burst length of two, A1–A9 select the block of two burst; A0 selects the starting column within the block.
3. For a burst length of four, A2–A9 select the block of four burst; A0-A1 select the starting column within the block.
4. For a burst length of eight, A3–A9 select the block of eight burst; A0–A2 select the starting column within the block.
5. For a full-page burst, the full row is selected and A0–A9 select the starting column.
6. Whenever a boundary of the block is reached within a given sequence above, the following access wraps within the block.
7. For a burst length of one, A0–A9 select the unique column to be accessed, and Mode Register bit M3 is ignored.For a full-page burst, the full row is selected and A0–A8 select the starting column.

Figure 6: CAS Latency Diagram



CAS Latency

The CAS latency is the delay, in clock cycles, between the registration of a READ command and the availability of the first piece of output data. The latency can be set to two or three clocks.

If a READ command is registered at clock edge *n*, and the latency is *m* clocks, the data will be available by clock edge *n* + *m*. The DQ will start driving as a result of the clock edge one cycle earlier (*n* + *m* - 1), and provided that the relevant access times are met, the data will be valid by clock edge *n* + *m*. For example, assuming that the clock cycle time is such that all relevant access times are met, if a READ command is registered at T0 and the latency is programmed to two clocks, the DQ will start driving after T1 and the data will be valid by T2, as shown in Figure 6, CAS Latency Diagram. Table 8, CAS Latency Table, indicates the operating frequencies at which each CAS latency setting can be used.

Reserved states should not be used as unknown operation or incompatibility with future versions may result.

Operating Mode

The normal operating mode is selected by setting M7 and M8 to zero; the other combinations of values for M7 and M8 are reserved for future use and/or test modes. The programmed burst length applies to both READ and WRITE bursts.

Test modes and reserved states should not be used because unknown operation or incompatibility with future versions may result.

Write Burst Mode

When M9 = 0, the burst length programmed via M0-M2 applies to both READ and WRITE bursts; when M9 = 1, the programmed burst length applies to READ bursts, but write accesses are single-location (non-burst) accesses.

Table 8: CAS Latency Table

SPEED	ALLOWABLE OPERATING CLOCK FREQUENCY (MHz)	
	CAS LATENCY = 2	CAS LATENCY = 3
-13E	≤ 133	≤ 143
-133	≤ 100	≤ 133
-10E	≤ 100	N/A

Commands

The Truth Table, below, provides a quick reference of available commands. This is followed by written description of each command. For a more detailed description of commands and operations, refer to the 128Mb SDRAM component data sheet.

Table 9: SDRAM Commands and DQMB Operation Truth Table

CKE is HIGH for all commands shown except SELF REFRESH

NAME (FUNCTION)	CS#	RAS#	CAS#	WE#	DQMB	ADDR	DQ	NOTES
COMMAND INHIBIT (NOP)	H	X	X	X	X	X	X	
NO OPERATION (NOP)	L	H	H	H	X	X	X	
ACTIVE (Select bank and activate row)	L	L	H	H	X	Bank/ Row	X	1
READ (Select bank and column, and start READ burst)	L	H	L	H	L/H	Bank/Col	X	2
WRITE (Select bank and column, and start WRITE burst)	L	H	L	L	L/H	Bank/Col	Valid	2
BURST TERMINATE	L	H	H	L	X	X	Active	
PRECHARGE (Deactivate row in bank or banks)	L	L	H	L	X	Code	X	3
AUTO REFRESH or SELF REFRESH (Enter self refresh mode)	L	L	L	H	X	X	X	4, 5
LOAD MODE REGISTER	L	L	L	L	X	Op-code	X	6
Write Enable/Output Enable	–	–	–	–	L	–	Active	7
Write Inhibit/Output High-Z	–	–	–	–	H	–	High-Z	7

NOTE:

1. A0–A11 provide row address; BA0–BA1 determine which device bank is made active.
2. A0–A9 provide column address; A10 HIGH enables the auto-precharge feature (nonpersistent), while A10 LOW disables the auto-precharge feature; BA0–BA1 determine which device bank is being read from or written to.
3. A10 LOW: BA0–BA1 determine which device bank is being precharged. A10 HIGH: all device banks are precharged and BA0, BA1 are "Don't Care."
4. This command is AUTO REFRESH if CKE is HIGH, SELF REFRESH if CKE is LOW.
5. Internal refresh counter controls row addressing; all inputs and I/Os are "Don't Care" except for CKE.
6. A0–A11 define the op-code written to the mode register.
7. Activates or deactivates the DQs during WRITEs (zero-clock delay) and READs (two-clock delay).

Absolute Maximum Ratings

Stresses greater than those listed may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Voltage on V_{DD}, $V_{DD}Q$ Supply
Relative to V_{SS} . . . . . -1V to +4.6V
Voltage on Inputs NC or I/O Pins

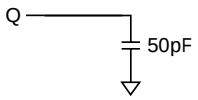
Notes

1. All voltages referenced to V_{SS}.
2. This parameter is sampled. V_{DD}, $V_{DD}Q$ = +3.3V; f = 1 MHz; T_A = 25°C; pin under test biased at 1.4V.
3. I_{DD} is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time and the outputs open.
4. Enables on-chip refresh and address counters.
5. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range is ensured (0°C ≤ T_A ≤ +70°C for Commercial, -40°C ≤ T_A ≤ +85°C for Industrial).
6. An initial pause of 100µs is required after power-up, followed by two AUTO REFRESH commands, before proper device operation is ensured. (V_{DD} and $V_{DD}Q$ must be powered up simultaneously. V_{SS} and $V_{SS}Q$ must be at same potential.) The two AUTO REFRESH command wake-ups should be repeated any time the ^{t}REF refresh requirement is exceeded.
7. AC characteristics assume ^{t}T = 1ns.
8. In addition to meeting the transition rate specification, the clock and CKE must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
9. Outputs measured at 1.5V with equivalent load:



10. ^{t}HZ defines the time at which the output achieves the open circuit condition; it is not a reference to V_{OH} or V_{OL}. The last valid data element will meet ^{t}OH before going High-Z.
11. AC timing and I_{DD} tests have V_{IL} = 0V and V_{IH} = 3V, with timing referenced to 1.5V crossover point. If the input transition time is longer than 1ns, then the timing is referenced at V_{IL} (MAX) and V_{IH} (MIN) and no longer at the ISV crossover point.
12. Other input signals are allowed to transition no more than once every two clocks and are otherwise at valid V_{IH} or V_{IL} levels.
13. I_{DD} specifications are tested after the device is properly initialized.
14. Timing actually specified by ^{t}CKS; clock(s) specified as a reference only at minimum cycle rate.
15. Timing actually specified by ^{t}WR plus ^{t}RP; clock(s) specified as a reference only at minimum cycle rate.
16. Timing actually specified by ^{t}WR.
17. Required clocks are specified by JEDEC functionality and are not dependent on any timing parameter.
18. The I_{DD} current will increase or decrease proportionally according to the amount of frequency alteration for the test condition.
19. Address transitions average one transition every two clocks.
20. CLK must be toggled a minimum of two times during this period.
21. Based on ^{t}CK = 10ns for -10E; ^{t}CK = 7.5ns for -133 and -13E.
22. V_{IH} overshoot: V_{IH} (MAX) = $V_{DD}Q$ + 2V for a pulse width ≤ 3ns, and the pulse width cannot be greater than one third of the cycle rate. V_{IL} undershoot: V_{IL} (MIN) = -2V for a pulse width ≤ 3ns.
23. The clock frequency must remain constant (stable clock is defined as a signal cycling within timing constraints specified for the clock pin) during access or precharge states (READ, WRITE, including ^{t}WR, and PRECHARGE commands). CKE may be used to reduce the data rate.
24. Auto precharge mode only. The precharge timing budget (^{t}RP) begins 7ns for -13E; 7.5ns for -133; and 7ns for -10E after the first clock delay, after the last WRITE is executed. May not exceed limit set for precharge mode.
25. Precharge mode only.
26. JEDEC and PC100 specify three clocks.
27. ^{t}AC for -133/-13E at CL = 3 with no load is 4.6ns and is guaranteed by design.
28. Parameter guaranteed by design.
29. For -13E, CL = 2 and ^{t}CK = 7.5ns; for -133, CL = 3 and ^{t}CK = 7.5ns; for -10E, CL=2 and ^{t}CK = 10ns
30. CKE is HIGH during refresh command period ^{t}RFC (MIN) else CKE is LOW. The I_{DD}6 limit is actually a nominal value and does not result in a fail value.
31. Refer to device data sheet for timing waveforms.
32. The value of ^{t}RAS used in -13E speed grade modules is calculated from ^{t}RC - ^{t}RP.
33. Leakage number reflects the worst case leakage possible through the module pin, not what each memory device contributes.

SPD Clock and Data Conventions

Data states on the SDA line can change only during SCL LOW. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions (as shown in Figure 7, Data Validity, and Figure 8, Definition of Start and Stop).

SPD Start Condition

All commands are preceded by the start condition, which is a HIGH-to-LOW transition of SDA when SCL is HIGH. The SPD device continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition has been met.

SPD Stop Condition

All communications are terminated by a stop condition, which is a LOW-to-HIGH transition of SDA when SCL is HIGH. The stop condition is also used to place the SPD device into standby power mode.

SPD Acknowledge

Acknowledge is a software convention used to indicate successful data transfers. The transmitting device, either master or slave, will release the bus after transmitting eight bits. During the ninth clock cycle, the receiver will pull the SDA line LOW to acknowledge that it received the eight bits of data (as shown in Figure 9, Acknowledge Response From Receiver).

The SPD device will always respond with an acknowledge after recognition of a start condition and its slave address. If both the device and a WRITE operation have been selected, the SPD device will respond with an acknowledge after the receipt of each subsequent eight bit word. In the read mode the SPD device will transmit eight bits of data, release the SDA line and monitor the line for an acknowledge. If an acknowledge is detected and no stop condition is generated by the master, the slave will continue to transmit data. If an acknowledge is not detected, the slave will terminate further data transmissions and await the stop condition to return to standby power mode.

Clock LOW period	^{t}LOW	1.3		µs	
SDA and SCL rise time	^{t}R		0.3	µs	2
SCL clock frequency	^{f}SCL		400	KHz	
Data-in setup time	$^{t}SU:DAT$	100		ns	
Start condition setup time	$^{t}SU:STA$	0.6		µs	3
Stop condition setup time	$^{t}SU:STO$	0.6		µs	
WRITE cycle time	^{t}WRC		10	ms	4

NOTE:

1. To avoid spurious START and STOP conditions, a minimum delay is placed between SCL=1 and the falling or rising edge of SDA.
2. This parameter is sampled.
3. For a reSTART condition, or following a WRITE cycle.
4. The SPD EEPROM WRITE cycle time (^{t}WRC) is the time from a valid stop condition of a write sequence to the end of the EEPROM internal erase/program cycle. During the WRITE cycle, the EEPROM bus interface circuit is disabled, SDA remains HIGH due to pull-up resistor, and the EEPROM does not respond to its slave address.

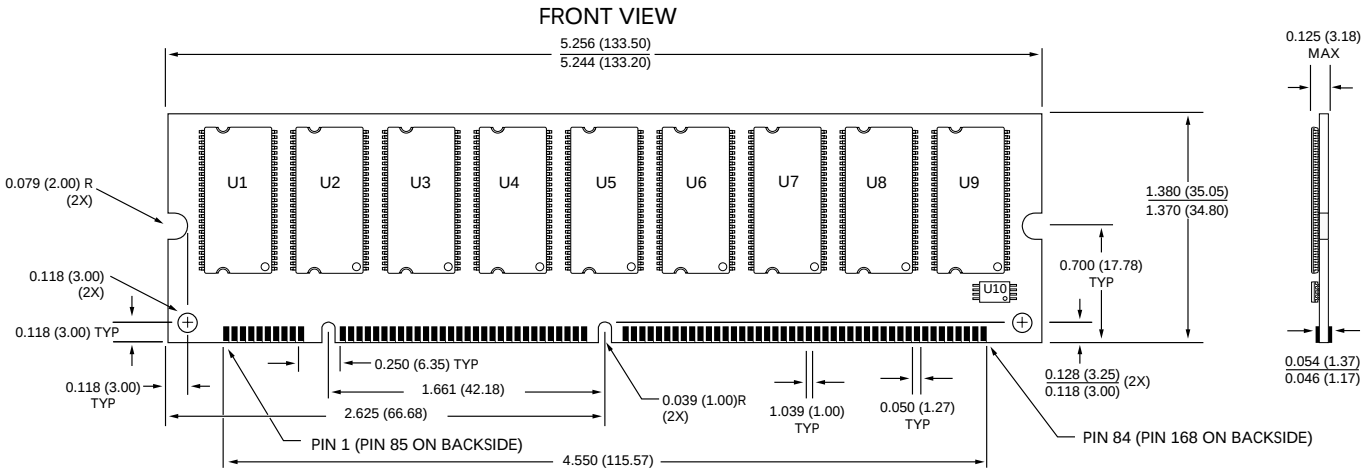
65-71	Manufacturer's JEDEC ID Code(Cont.)		FF	FF
72	Manufacturing Location	1–12	01–0C	01–0C
73-90	Module Part Number (ASCII)		Variable Data	Variable Data
91	PCB Identification Code	1–9	01–09	01–09
92	Identification Code (Cont.)	0	00	00
93	Year of Manufacture in BCD		Variable Data	Variable Data
94	Week of Manufacture in BCD		Variable Data	Variable Data
95-98	Module Serial Number		Variable Data	Variable Data
99-125	Manufacturer-Specific Data (RSVD)			
126	System Frequency	100 MHz (-13E/-133/-10E)	64	64
127	SDRAM Component & Clock Detail		AF	FF

NOTE:

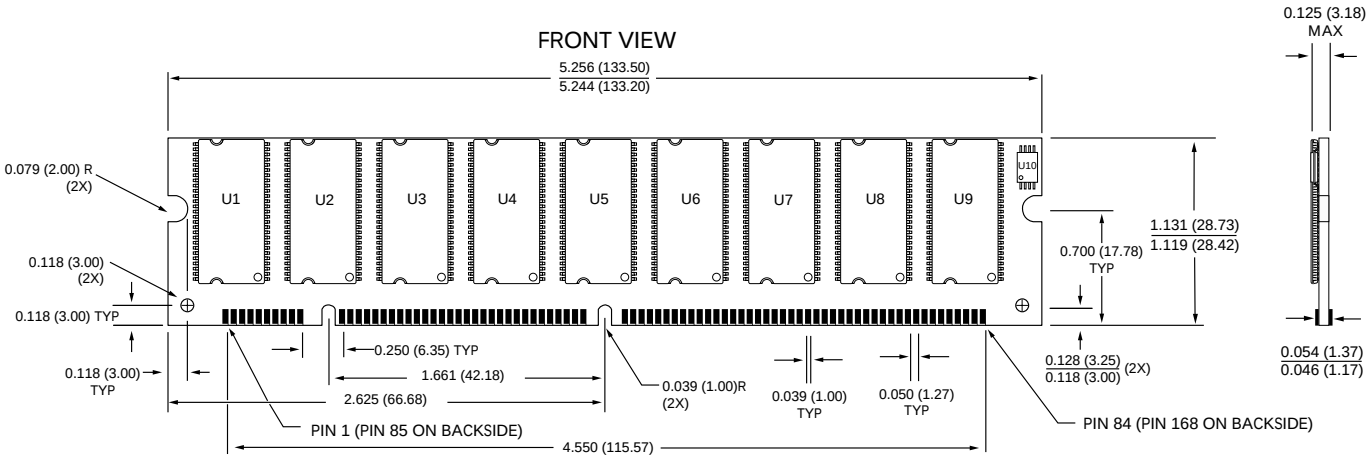
1. The value of ^{t}RAS used for -13E modules is calculated from ^{t}RC - ^{t}RP. Actual device specification value is 37ns.

Figure 11: 168-Pin DIMM Dimensions – Single Rank

STANDARD PCB



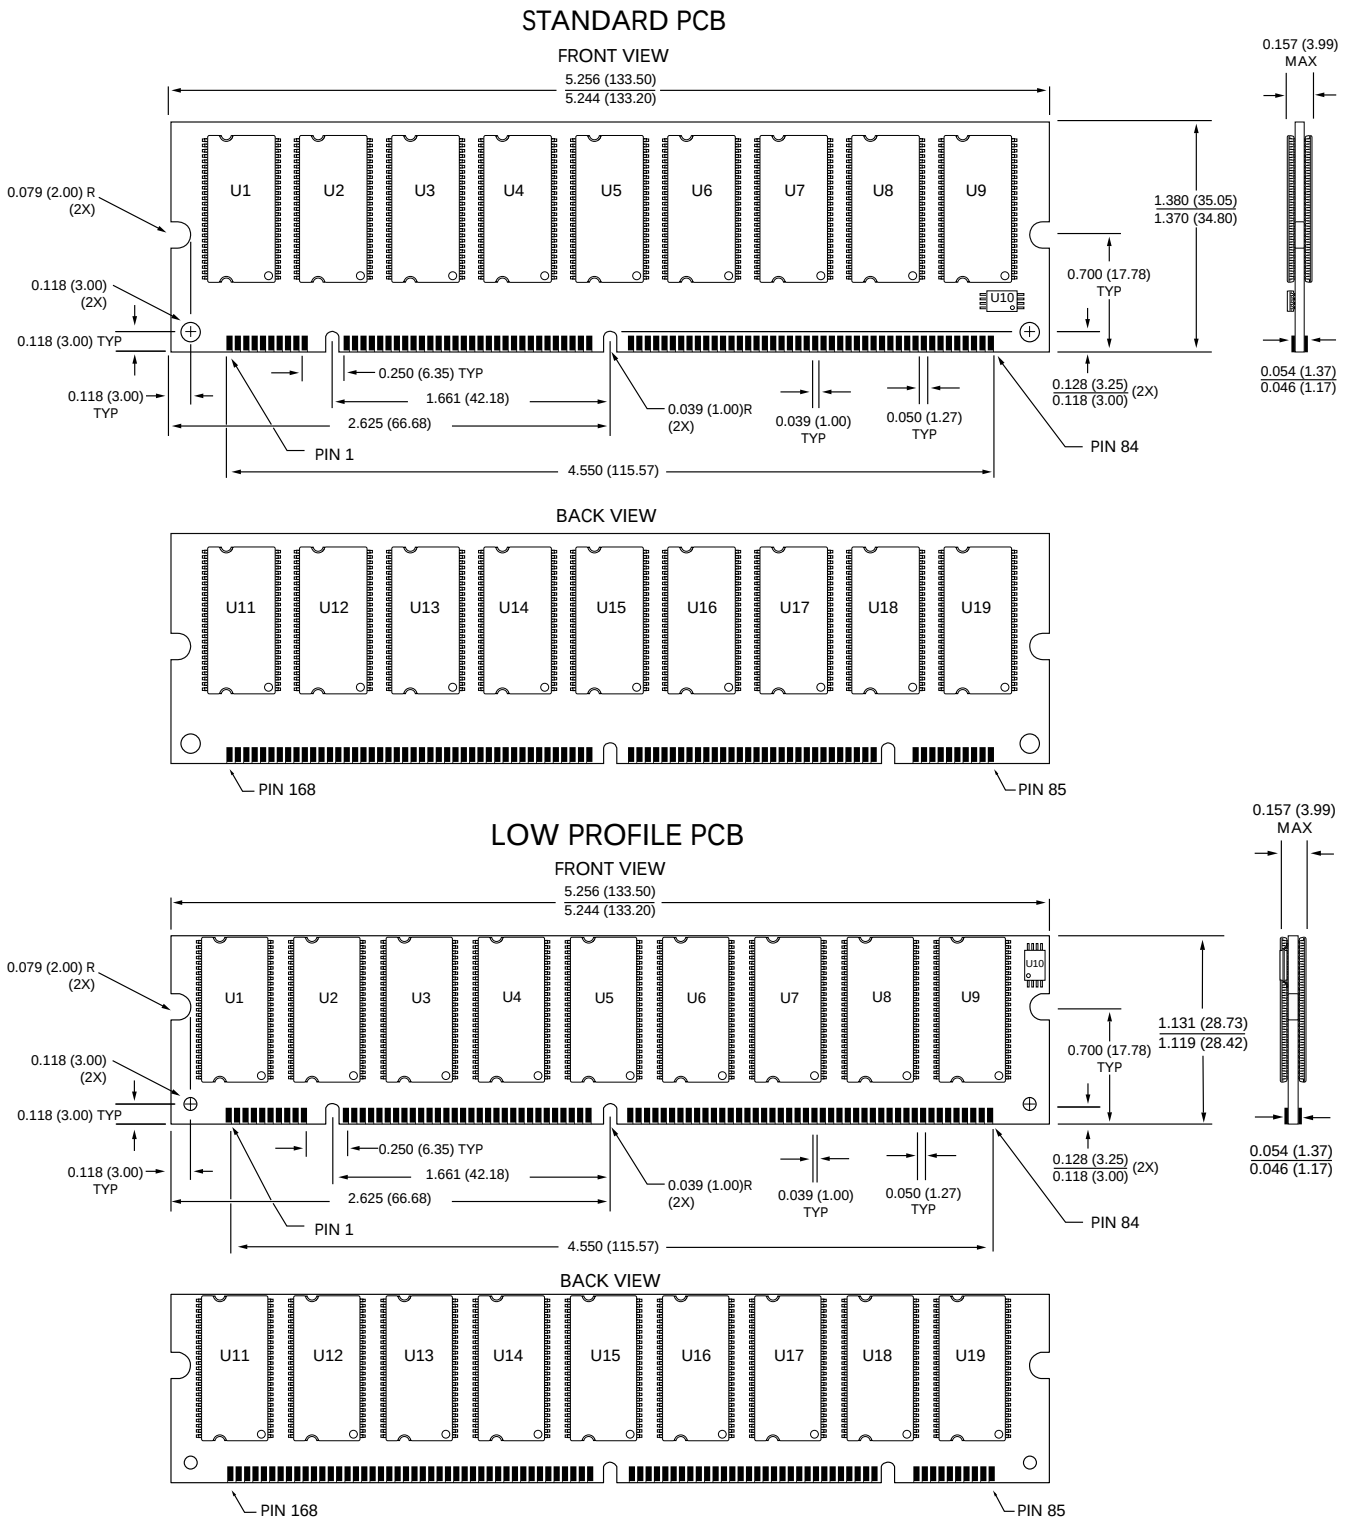
LOW PROFILE PCB



NOTE:

All dimensions in inches (millimeters); $\frac{\text{MAX}}{\text{MIN}}$ or typical where noted.

Figure 12: 168-Pin DIMM Dimensions – Low-Profile PCB



NOTE:

All dimensions in inches (millimeters); $\frac{\text{MAX}}{\text{MIN}}$ or typical where noted.

Data Sheet Designation

Released (No Mark): This data sheet contains minimum and maximum limits specified over the complete power supply and temperature range for production devices. Although considered final, these specifications are subject to change, as further product development and data characterization sometimes occur.
