

Description

E-T-A's ESX10-T electronic circuit protector is only 12.5 mm wide and selectively protects all DC 24 V load circuits, thereby increasing the uptime of machines and systems. This is achieved by a combination of active electronic current limitation in the event of a short circuit and overload disconnection typically from 1.1 times rated current. The ESX10-T responds faster than frequently used DC 24 V switch mode power supplies without tripping fast and thus prevents disastrous voltage dips of the supply. It works with a single trip curve for all loads. Even capacitive loads up to 75,000 µF can be handled very easily. Besides fixed current ratings from 0.5 A to 12 A, adjustable current rating versions are also available. The integral fail-safe element (fuse) is adjusted to the circuit protector's rated current and can thus very easily be synchronised with the wired cable cross section. This makes planning much easier.

ESX10-TD

Features

- Track-mountable
- Active linear current limitation
- Capacitive loads up to 75,000 µF
- ESX10-TA/-TB: fixed current ratings 0.5 A...12 A
- ESX10-TD: adjustable current ratings, e.g. [0.5 A / 1 A / 2 A]; [2 A / 4 A / 6 A]; [6 A / 8 A / 10 A]
- Approvals: UL, CSA, GL
- OPTION: Control inputs, signalling
- OPTION: ATEX approval

Your benefits

- Increases machine uptime through clear failure detection and stable power supply
- Reduces downtimes through quick fault resolution
- Simplifies planning through clear sizes and ratings
- Saves costs and time through fast and flexible mounting including integral power distribution solution

Notes

- The user has to ensure that the cable cross section of the load circuit in question complies with the current rating of the ESX10-T used.
- In addition special precautions have to be taken in the system or machinery to exclude automatic re-start (e.g. by using a safety PLC) (cf. Machinery Directive 2006/42/EG und EN 60204-1, Safety of Machinery). In the event of a failure (short circuit/overload) the load circuit will be disconnected electronically by the ESX10-T.

ESX10-TD
Wiring diagram similar to ESX10-TB without busbars (on the front)

Typical time/current characteristic ($T_{amb} = 25^\circ C$)

- In a range of $1.1...1.8 \times I_N$ the trip time is typically 3 s. (e.g. ESX10-TB-...-6 A)
- The electronic current limitation typically begins in at $1.8 \times I_N$. This means: under all overload conditions (independent of power supply and load circuit resistance) **typically 1.8 times rated current is applied until disconnection**. The corresponding current limitation value I_{Limit} depends on the current rating of the device I_N (see table 1) The trip time varies between 100 ms and 3 s depending on the multiple of the current rating or at short circuit (I_K).
- Without the current limitation getting into effect at typically $1.8 \times I_N$ there would be a much higher overcurrent in the event of an overload or short circuit.

Mounting examples for ESX10-T

5 ESX10-TA
with busbars

5 ESX10-TB
with busbars
and jumpers

5 ESX10-TD
with busbars

Description of installation:

With a block of devices the busbars have to be inserted before wiring.
Max. 10 plug-in cycles for busbars allowed.

Recommendation:

The line entry busbars and signal busbars should be interrupted after 10 devices and line entry should start anew.

Description

The ESX10-T has an integral power distribution system. The following wirings can be carried out with different plug-in type busbars:

- LINE +(DC 24 V)
- 0 V
- **Important:** The electronic devices ESX10-T require a 0 V connection.
- Auxiliary contacts
- Reset inputs

Accessories

Busbars for LINE+ and 0 V

ampacity with one input I_{max} 50 A
