DM2502, DM2503, DM2504 Successive Approximation Registers

General Description

The DM2502, DM2503 and DM2504 are 8-bit and 12-bit TTL registers designed for use in successive approximation A/D converters. These devices contain all the logic and control circuits necessary in combination with a D/A converter to perform successive approximation analog-to-digital conversions.

The DM2502 has 8 bits with serial capability and is not expandable. The DM2503 has 8 bits and is expandable without serial capability. The DM2504 has 12 bits with serial capability and expandability.

All three devices are available in ceramic DIP, ceramic flatpak, and molded Epoxy-B DIPs. The DM2502, DM2503 and DM2504 operate over −55°C to +125°C; the DM2502C, DM2503C and DM2504C operate over 0°C to +70°C.

Features

- Complete logic for successive approximation A/D converters
- 8-bit and 12-bit registers
- Capable of short cycle or expanded operation
- Continuous or start-stop operation
- Compatible with D/A converters using any logic code
- Active low or active high logic outputs
- Use as general purpose serial-to-parallel converter or ring counter

Absolute Maximum Ratings (Note 1)

Supply Voltage	7V
Input Voltage	5.5V
Output Voltage	5.5V
Storage Temperature Range	−65°C to +150°C
Lead Temperature (Soldering, 10 seconds)	300°C

Operating Conditions

	Min	Max	Units
Supply Voltage, V_{CC}			
DM2502C, DM2503C, DM2504C	4.75	5.25	V
DM2502, DM2503, DM2504	4.5	5.5	V
Temperature, T_A			
DM2502C, DM2503C, DM2504C	0	+70	°C
DM2502, DM2503 DM2504	−55	+125	°C

Electrical Characteristics (Notes 2 and 3) V_{CC} = 5.0V, T_A = 25°C, C_L = 15 pF, unless otherwise specified.

Parameter	Conditions	Min	Typ	Max	Units
Logical "1" Input Voltage (V_{IH})	V_{CC} = Min	2.0			V
Logical "1" Input Current (I_{IH})	V_{CC} = Max				
CP Input	V_{IH} = 2.4V		6	40	μA
D, $\overline{E}$, $\overline{S}$ Inputs	V_{IH} = 2.4V		6	80	μA
All Inputs	V_{IH} = 5.5V			1.0	mA
Logical "0" Input Voltage (V_{IL})	V_{CC} = Min			0.8	V
Logical "0" Input Current (I_{IL})	V_{CC} = Max				
CP, $\overline{S}$ Inputs	V_{IL} = 0.4V		−1.0	−1.6	mA
D, E Inputs	V_{IL} = 0.4V		−1.0	−3.2	mA
Logical "1" Output Voltage (V_{OH})	V_{CC} = Min, I_{OH} = 0.48 mA	2.4	3.6		V
Output Short Circuit Current (Note 4) (I_{OS})	V_{CC} = Max; V_{OUT} = 0.0V; Output High; CP, D, $\overline{S}$, High; $\overline{E}$ Low	−10	−20	−45	mA
Logical "0" Output Voltage (V_{OL})	V_{CC} = Min, I_{OL} = 9.6 mA		0.2	0.4	V
Supply Current (I_{CC})	V_{CC} = Max, All Outputs Low				
DM2502C			65	95	mA
DM2502			65	85	mA
DM2503C			60	90	mA
DM2503			60	80	mA
DM2504C			90	124	mA
DM2504			90	110	mA
Propagation Delay to a Logical "0" From CP to Any Output (t_{pd0})		10	18	28	ns
Propagation Delay to a Logical "0" From $\overline{E}$ to Q7 (Q11) Output (t_{pd0})	CP High, $\overline{S}$ Low DM2503, DM2503C, DM2504, DM2504C Only		16	24	ns
Propagation Delay to a Logical "1" From CP to Any Output (t_{pd1})		10	26	38	ns
Propagation Delay to a Logical "1" From $\overline{E}$ to Q7 (Q11) Output (t_{pd1})	CP High, $\overline{S}$ Low DM2503, DM2503C, DM2504, DM2504C Only		13	19	ns
Set-Up Time Data Input ($t_{s(D)}$)		−10	4	8	ns
Set-Up Time Start Input ($t_{s(\overline{S})}$)		0	9	16	ns
Minimum Low CP Width (t_{PWL})			30	42	ns
Minimum High CP Width (t_{PWH})			17	24	ns
Maximum Clock Frequency (f_{MAX})		15	21		MHz

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.

Note 2: Unless otherwise specified min/max limits apply across the −55°C to +125°C temperature range for the DM2502, DM2503 and DM2504, and across the 0°C to +70°C range for the DM2502C, DM2503C and DM2504C. All typicals are given for V_{CC} = 5.0V and T_A = 25°C.

Note 3: All currents into device pins shown as positive, out of device pins as negative, all voltages referenced to ground unless otherwise noted. All values shown as max or min on absolute value basis.

Note 4: Only one output at a time should be shorted.

Application Information

OPERATION

The registers consist of a set of master latches that act as the control elements in the device and change state on the input clock high-to-low transition and a set of slave latches that hold the register data and change on the input clock low-to-high transition. Externally the device acts as a special purpose serial-to-parallel converter that accepts data at the D input of the register and sends the data to the appropriate slave latch to appear at the register output and the DO output on the DM2502 and DM2504 when the clock goes from low-to-high. There are no restrictions on the data input; it can change state at any time except during a short interval centered about the clock low-to-high transition. At the same time that data enters the register bit the next less significant bit register is set to a low ready for the next iteration.

The register is reset by holding the $\overline{S}$ (Start) signal low during the clock low-to-high transition. The register synchronously resets to the state Q7 (11) low, and all the remaining register outputs high. The Q_{CC} (Conversion Complete) signal is also set high at this time. The $\overline{S}$ signal should not be brought back high until after the clock low-to-high transition in order to guarantee correct resetting. After the clock has gone high resetting the register, the $\overline{S}$ signal must be removed. On the next clock low-to-high transition the data on the D input is set into the Q7 (11) register bit and the Q6 (10) register bit is set to a low ready for the next clock cycle. On the next clock low-to-high transition data enters the Q6 (10) register bit and Q5 (9) is set to a low. This operation is repeated for each register bit in turn until the register has been filled. When the data goes into Q0, the Q_{CC} signal goes low, and the register is inhibited from further change until reset by a Start signal.

The DM2502, DM2503 and DM2504 have a specially tailored two-phase clock generator to provide nonoverlapping two-phase clock pulses (i.e., the clock waveforms intersect below the thresholds of the gates they drive). Thus, even at very slow dV/dt rates at the clock input (such as from relatively weak comparator outputs), improper logic operation will not result.

LOGIC CODES

All three registers can be operated with various logic codes. Two's complement code is used by offsetting the comparator ½ full range + ½ LSB and using the complement of the MSB ($\overline{Q7}$ or $\overline{Q11}$) with a binary D/A converter. Offset binary is used in the same manner but with the MSB ($\overline{Q}7$ or $\overline{Q}11$). BCD D/A converters can be used with the addition of illegal code suppression logic.

ACTIVE HIGH OR ACTIVE LOW LOGIC

The register can be used with either D/A converters that require a low voltage level to turn on, or D/A converters that require a high voltage level to turn the switch on. If D/A converters are used which turn on with a low logic level, the resulting digital output from the register is active low. That is, a logic "1" is represented as a low voltage level. If D/A converters are used that turn on with a high logic level then the digital output is active high; a logic "1" is represented as a high voltage level.

EXPANDED OPERATION

An active low enable input, $\overline{E}$, on the DM2503 and DM2504 allows registers to be connected together to form a longer register by connecting the clock, D, and $\overline{S}$ inputs in parallel and connecting the Q_{CC} output of one register to the $\overline{E}$ input of the next less significant register. When the start resets the register, the $\overline{E}$ signal goes high, forcing the Q7 (11) bit high and inhibiting the register from accepting data until the previous register is full and its Q_{CC} goes low. If only one register is used the $\overline{E}$ input should be held at a low logic level.

Application Information (Continued)

SHORT CYCLE

If all bits are not required, the register may be truncated and conversion time saved by using a register output going low rather then the Q_{CC} signal to indicate the end of conversion. If the register is truncated and operated in the continuous conversion mode, a lock-up condition may occur on power turn-on. This condition can be avoided by making the start input the OR function of Q_{CC} and the appropriate register output.

COMPARATOR BIAS

To minimize the digital error below $\pm\frac{1}{2}$ LSB, the comparator must be biased. If a D/A converter is used which requires a low voltage level to turn on, the comparator should be biased $+\frac{1}{2}$ LSB. If the D/A converter requires a high logic level to turn on, the comparator must be biased $-\frac{1}{2}$ LSB.

Definition of Terms

CP: The clock input of the register.

D: The serial data input of the register.

DO: The serial data out. (The D input delayed one bit).

$\overline{E}$: The register enable. This input is used to expand the length of the register and when high forces the Q7 (11) register output high and inhibits conversion. When not used for expansion the enable is held at a low logic level (ground).

Q_i i = 7 (11) to 0: The outputs of the register.

Q_{CC}: The conversion complete output. This output remains high during a conversion and goes low when a conversion is complete.

Q7 (11): The true output of the MSB of the register.

$\overline{Q}$7 (11): The complement output of the MSB of the register.

$\overline{S}$: The start input. If the start input is held low for at least a clock period the register will be reset to Q7 (11) low and all the remaining outputs high. A start pulse that is low for a shorter period of time can be used if it meets the set-up time requirements of the $\overline{S}$ input.

Truth Table

DM2502, DM2503

Time	Inputs			Outputs[1]									
t_n	D	$\overline{S}$	$\overline{E}$[2]	D0[3]	Q7	Q6	Q5	Q4	Q3	Q2	Q1	Q0	Q_{CC}

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
