DESCRIPTION

The SY88922V is a high speed current switch for driving a semiconductor laser diode in optical transmission applications. The output current, or modulation current I_{MOD} , is DC current controlled by I_{RSET} , current through the resistor R_{SET} . The output OUT is HIGH when output enable is HIGH.

The device incorporates complementary open collector outputs with a capability of driving peak current of 30mA. The resistor R_{EXT} must be placed between /OUT and V_{CC} to dissipate the worst case power. R_{SER} is recommended to compensate for laser diode matching issues. Pin 9 and pin 10 should be connected to achieve better performance.

The SY88922V utilizes the high performance bipolar ASSET™ technology.
