MAXIM

Fast, Low-Voltage, Dual 4Ω SPDT CMOS Analog Switches

General Description

The MAX4635/MAX4636 are fast, dual 4Ω single-pole/double-throw (SPDT) analog switches that operate with supply voltages from +1.8V to +5.5V. High switching speeds, 1Ω on-resistance flatness, and low power consumption make these devices ideal for audio/video, communications, and battery-operated devices. Containing two independently controllable SPDT switches in 10-pin µMAX and 10-pin 3mm x 3mm thin QFN packages, the MAX4635/MAX4636 use little board space, and have low power consumption ensuring minimal impact on your power budget. The analog signal range extends to the supply rails. The MAX4635 has inverted logic compared to the MAX4636.

Applications

Battery-Powered Equipment

Relay Replacement

Audio and Video Signal Routing

Low-Voltage Data-Acquisition Systems

Sample-and-Hold Circuits

Communications Circuits

Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.

Features

- **Guaranteed On-Resistance**
  4Ω (max) +5V Supply
  5.5Ω (max) +3V Supply
- **Guaranteed Match Between Channels**
  0.2Ω (max)
- **Guaranteed Flatness Over Signal Range**
  1Ω (max) with +5V Supply
- **Fast Switching Speeds**
  14ns (max) Turn-On Time
  6ns (max) Turn-Off Time
- **1.8V Operation**
  100Ω (typ) On-Resistance Over Temperature
  56ns (typ) Turn-On Time
  17ns (typ) Turn-Off Time
- **+1.8V to +5.5V Single-Supply Operation**
- **Rail-to-Rail® Signal Handling**
- **Low Crosstalk: -67dB at 1MHz**
- **High Off-Isolation: -65dB at 1MHz**
- **THD: 0.1%**

Fast, Low-Voltage, Dual 4Ω SPDT CMOS Analog Switches

ABSOLUTE MAXIMUM RATINGS

(Voltages Referenced to GND)
V+, IN_ .....-0.3V to +6V
COM_, NC_, NO_ (Note 1) ..... -0.3V to (V+ + 0.3V)
Continuous Current into Any Terminal .....±30mA
Peak Current into COM_, NC_, NO_
(pulsed at 1ms, 10% duty cycle).....±100mA

Continuous Power Dissipation (T_A = +70°C)
10-Pin µMAX (derate 4.7mW/°C above +70°C) 330mW
10-Pin Thin QFN (derate 24.4mW/°C above +70°C) ..1951mW
Operating Temperature Range ..... -40°C to +85°C
Storage Temperature Range ..... -65°C to +150°C
Lead Temperature (soldering, 10s) ..... +300°C

Note 1: Signals on NO_, NC_, or COM_ exceeding V+ or GND are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS—Single +5V Supply

Note 2: The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.

Note 3: $\Delta R_{ON} = R_{ON(MAX)} - R_{ON(MIN)}$.

Note 4: ΔR_{ON} matching specifications for QFN-packaged parts are guaranteed by design.

Note 5: Flatness is defined as the difference between the maximum and minimum values of on-resistance as measured over the specified analog signal ranges.

Note 6: Guaranteed by design.

Note 7: Off-Isolation = $20\log_{10}$ (V_{COM} / V_{NO}), V_{COM} = output, V_{NO} = input to off switch.

Note 8: Between any two switches.

Note 9: QFN packaged parts are tested at +25°C and guaranteed by design and correlation over the entire temperature range.

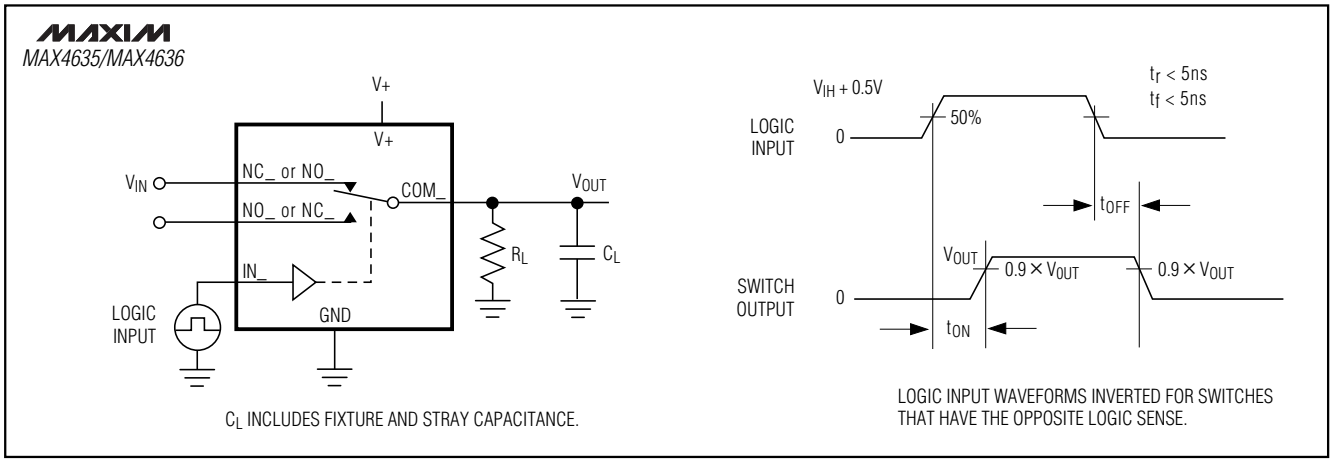

Figure 1a. Switching Time

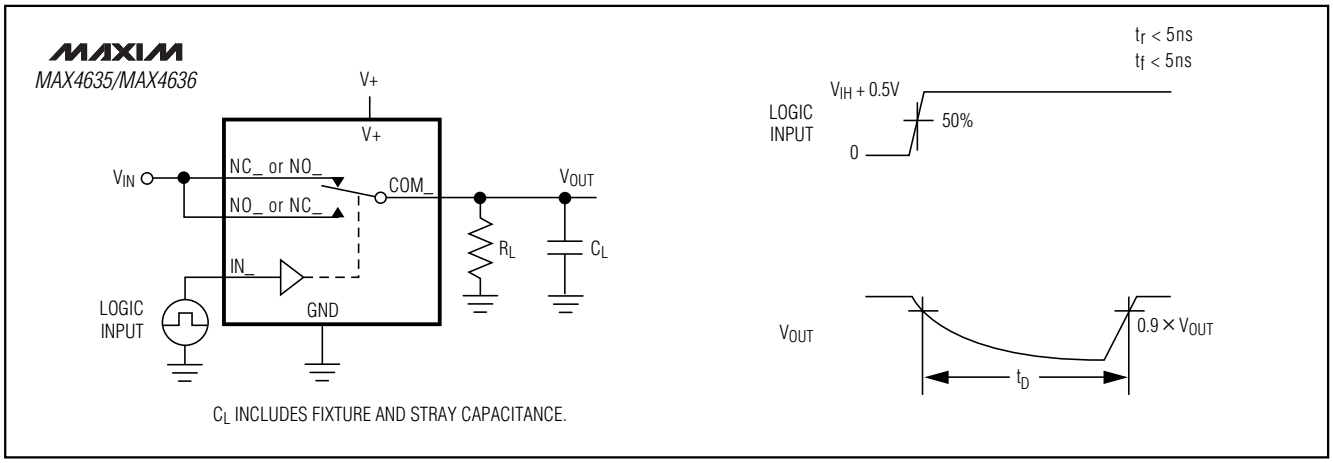

Figure 1b. Break-Before-Make Interval

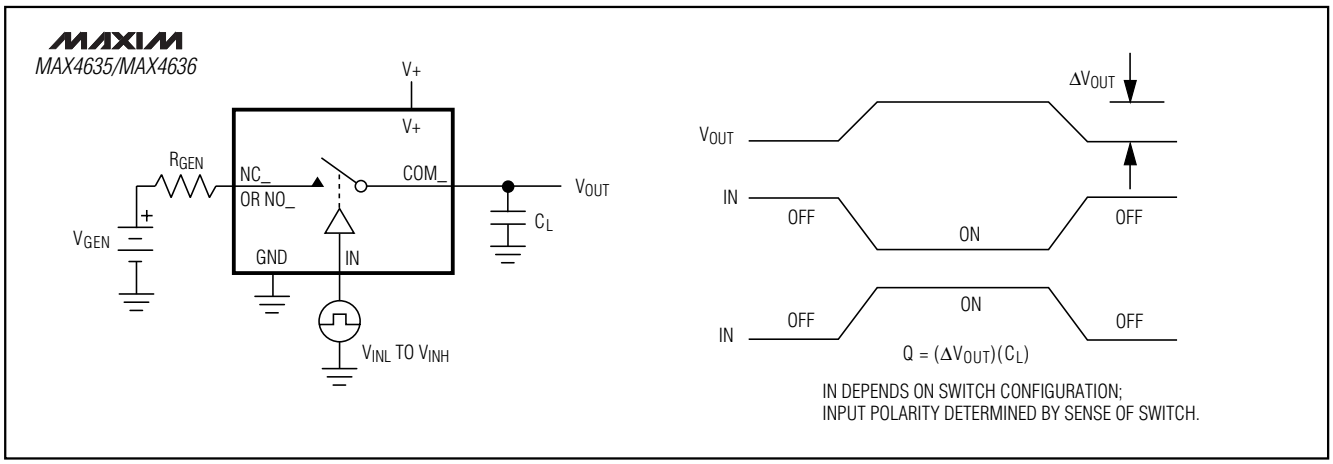

Figure 2. Charge Injection

Fast, Low-Voltage, Dual 4Ω SPDT CMOS Analog Switches

Detailed Description

The MAX4635/MAX4636 are low-on-resistance (R_{ON}), low-voltage, dual SPDT analog switches that operate from a +1.8V to +5.5V supply. The MAX4635/MAX4636 feature very fast switching speed (t_{ON} = 14ns max, t_{OFF} = 6ns max) and guaranteed break-before-make switching. The low maximum R_{ON} allows high continuous currents to be switched in a variety of applications.

Applications Information

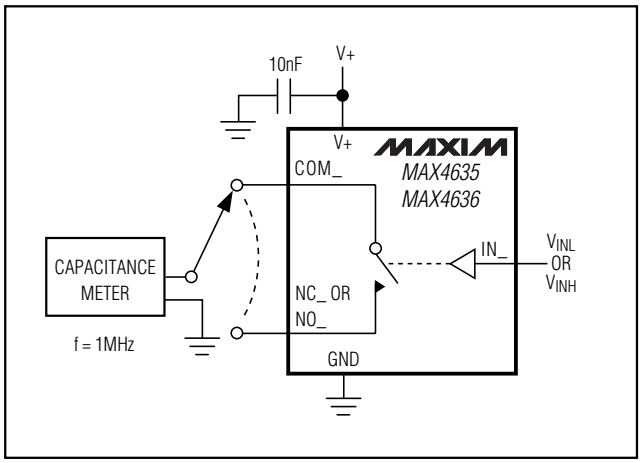

Figure 3. Channel Off/On-Capacitance

Logic Inputs

The MAX4635/MAX4636 logic inputs (IN1, IN2) can be driven up to +5.5V, regardless of the voltage on V+. This allows interfacing to 5V logic signals while operating with a +3.3V supply voltage without external level translation.

Analog Signal Levels

Analog signals ranging over the entire supply voltage (V+ to GND) can be passed with very little change in on-resistance (see *Typical Operating Characteristics*). The switches are bidirectional, so the NO_, NC_, and COM_ pins may be used as either inputs or outputs.

Power-Supply Sequencing and Overvoltage Protection

Caution: Do not exceed the absolute maximum ratings because stresses beyond the listed ratings can cause permanent damage to the device. Proper power-supply sequencing is recommended for all CMOS devices. Always apply V+ before applying analog signals, especially if the analog signal is not current limited. If this sequencing is not possible, and if the analog inputs are not current limited to less than 30mA, add a small-signal diode (D1) as shown in Figure 5. If the analog signal can dip below GND, add D2. Adding protection diodes reduces the analog range to a diode drop (about 0.7V) below V+ (for D1), and a diode drop above ground (for D2).

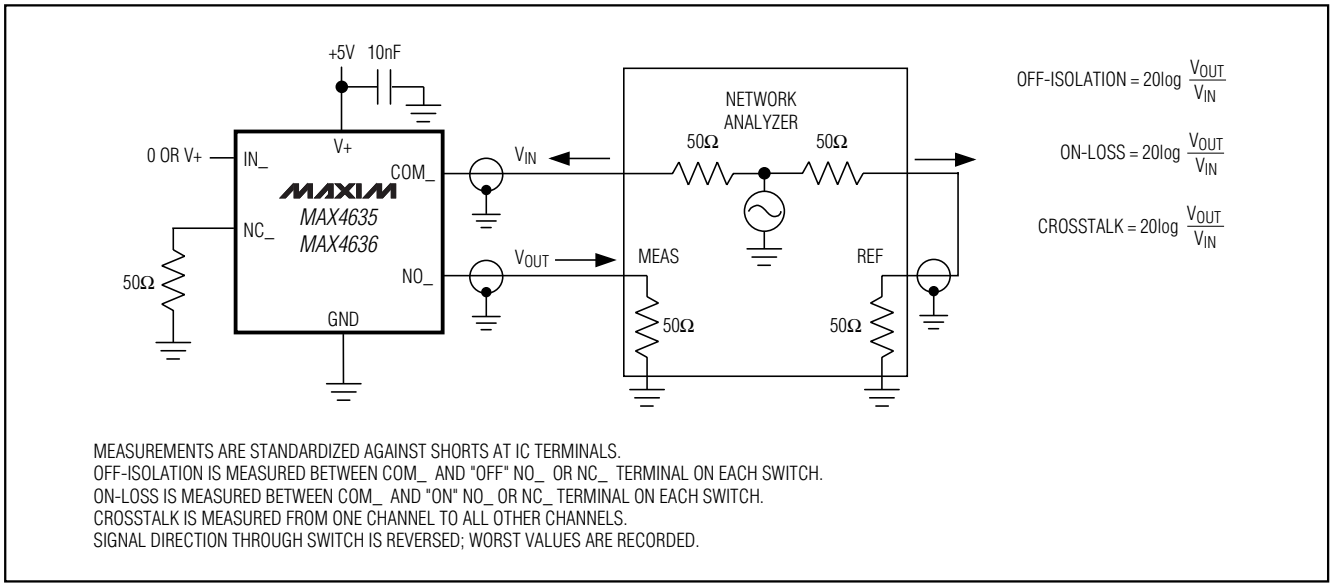

Figure 4. On-Loss, Off-Isolation, and Crosstalk

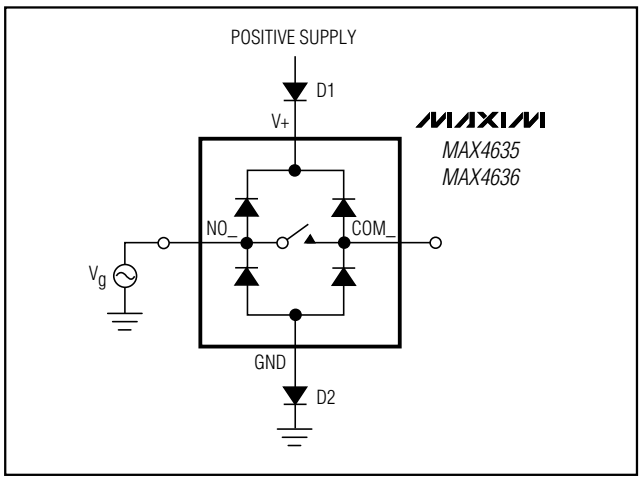

Figure 5. Overvoltage Protection Using Two External Blocking Diodes

On-resistance increases slightly at low supply voltages. Maximum supply voltage (V+) must not exceed +6V. Adding protection diode D2 causes the logic threshold to be shifted relative to GND. Protection diodes D1 and D2 also protect against some overvoltage situations. With Figure 5's circuit, if the supply voltage is below the absolute maximum rating, and if a fault voltage up to the absolute maximum rating is applied to an analog signal pin, no damage results.
