

5.0 or 3.3V, 256 Kbit (32 Kbit x 8) ZEROPOWER® SRAM

FEATURES SUMMARY

- INTEGRATED, ULTRA LOW POWER SRAM, POWER-FAIL CONTROL CIRCUIT, and BATTERY
- READ CYCLE TIME EQUALS WRITE CYCLE TIME
- BATTERY LOW FLAG ($\overline{\text{BOK}}$)
- AUTOMATIC POWER-FAIL CHIP DESELECT and WRITE PROTECTION
- WRITE PROTECT VOLTAGES:
(V_{PFD} = Power-fail Deselect Voltage)
 - M48Z35AY: $4.2\text{V} \leq V_{\text{PFD}} \leq 4.5\text{V}$
 - M48Z35AV: $2.7\text{V} \leq V_{\text{PFD}} \leq 3.0\text{V}$
- SELF-CONTAINED BATTERY IN THE CAPHAT™ DIP PACKAGE
- PACKAGING INCLUDES A 28-LEAD SOIC and SNAPHAT® TOP (to be Ordered Separately)
- PIN and FUNCTION COMPATIBLE WITH JEDEC STANDARD 32K x 8 SRAMs
- SOIC PACKAGE PROVIDES DIRECT CONNECTION FOR A SNAPHAT TOP WHICH CONTAINS THE BATTERY

DESCRIPTION

The M48Z35AY/V ZEROPOWER® RAM is a 32 Kbit x 8, non-volatile static RAM that integrates power-fail deselect circuitry and battery control logic on a single die. The monolithic chip is available in two special packages to provide a highly integrated battery backed-up memory solution.

The M48Z35AY/V is a non-volatile pin and function equivalent to any JEDEC standard 32K x8 SRAM. It also easily fits into many ROM, EPROM, and EEPROM sockets, providing the non-volatility of PROMs without any requirement for special WRITE timing or limitations on the number of WRITES that can be performed. The 28 pin 600mil DIP CAPHAT™ houses the M48Z35AY/V silicon with a long life lithium button cell in a single package.

The 28-pin, 330mil SOIC provides sockets with gold plated contacts at both ends for direct connection to a separate SNAPHAT® housing containing the battery. The unique design allows the SNAPHAT battery package to be mounted on top of the SOIC package after the completion of the surface mount process. Insertion of the SNAPHAT housing after reflow prevents potential battery damage due to the high temperatures required for device surface-mounting. The SNAPHAT housing is keyed to prevent reverse insertion.

The SOIC and battery packages are shipped separately in plastic anti-static tubes or in Tape & Reel form.

For the 28-lead SOIC, the battery package (e.g., SNAPHAT) part number is "M4Z28-BR00SH1."

MAXIMUM RATING

Stressing the device above the rating listed in the “Absolute Maximum Ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is

not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Table 2. Absolute Maximum Ratings

Symbol	Parameter		Value	Unit
T_A	Ambient Operating Temperature	Grade 1	0 to 70	°C
		Grade 6	–40 to 85	°C
T_{STG}	Storage Temperature (V_{CC} Off, Oscillator Off)	SNAPHAT®	–40 to 85	°C
		SOIC	–55 to 125	°C
$T_{SLD}^{(1)}$	Lead Solder Temperature for 10 seconds		260	°C
V_{IO}	Input or Output Voltages	M48Z35AY	–0.3 to 7.0	V
		M48Z35AV	–0.3 to 4.6	V
V_{CC}	Supply Voltage	M48Z35AY	–0.3 to 7.0	V
		M48Z35AV	–0.3 to 4.6	V
I_O	Output Current		20	mA
P_D	Power Dissipation		1	W

Note: 1. For DIP package: Soldering temperature not to exceed 260°C for 10 seconds (total thermal budget not to exceed 150°C for longer than 30 seconds).
 2. For SO package: Reflow at peak temperature of 215°C to 225°C for < 60 seconds (total thermal budget not to exceed 180°C for between 90 to 120 seconds).

CAUTION: Negative undershoots below –0.3V are not allowed on any pin while in the Battery Back-up mode.

CAUTION: Do NOT wave solder SOIC to avoid damaging SNAPHAT sockets.

DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, as well as the DC and AC characteristics of the device. The parameters in the following DC and AC Characteristic tables are derived from tests performed under the Measure-

ment Conditions listed in the relevant tables. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.

Table 3. Operating and AC Measurement Conditions

Parameter		M48Z35AY	M48Z35AV	Unit

2. Outputs deselected.

3. Negative spikes of $-1V$ allowed for up to $10ns$ once per cycle.

OPERATING MODES

The M48Z35AY/V also has its own Power-fail Detect circuit. The control circuitry constantly monitors the single power supply for an out of tolerance condition. When V_{CC} is out of tolerance, the circuit write protects the SRAM, providing a high degree

of data security in the midst of unpredictable system operation brought on by low V_{CC} . As V_{CC} falls below approximately V_{SO} , the control circuitry connects the battery which maintains data until valid power returns.

WRITE Mode

The M48Z35AY/V is in the WRITE Mode whenever $\overline{W}$ and $\overline{E}$ are low. The start of a WRITE is referenced from the latter occurring falling edge of $\overline{W}$ or $\overline{E}$. A WRITE is terminated by the earlier rising edge of $\overline{W}$ or $\overline{E}$. The addresses must be held valid throughout the cycle. $\overline{E}$ or $\overline{W}$ must return high for a minimum of t_{EHAX} from Chip Enable or t_{WHAX} from WRITE Enable prior to the initiation of another

er READ or WRITE cycle. Data-in must be valid t_{D-VWH} prior to the end of WRITE and remain valid for t_{WHDX} afterward. $\overline{G}$ should be kept high during WRITE cycles to avoid bus contention; although, if the output bus has been activated by a low on $\overline{E}$ and $\overline{G}$, a low on $\overline{W}$ will disable the outputs t_{WLQZ} after $\overline{W}$ falls.

2. $C_L = 5\text{pF}$ (see Figure 7, page 6).

3. If $\bar{E}$ goes low simultaneously with $\bar{W}$ going low, the outputs remain in the high impedance state.

Data Retention Mode

With valid V_{CC} applied, the M48Z35AY/V operates as a conventional BYTEWIDE™ static RAM. Should the supply voltage decay, the RAM will automatically power-fail deselect, write protecting itself when V_{CC} falls within the V_{PFD} (max), V_{PFD} (min) window. All outputs become high impedance, and all inputs are treated as “Don’t care.”

Note: A power failure during a WRITE cycle may corrupt data at the currently addressed location, but does not jeopardize the rest of the RAM’s content. At voltages below $V_{PFD}(\text{min})$, the user can be assured the memory will be in a write protected state, provided the V_{CC} fall time is not less than t_F . The M48Z35AY/V may respond to transient noise spikes on V_{CC} that reach into the deselect window during the time the device is sampling V_{CC} . Therefore, decoupling of the power supply lines is recommended.

When V_{CC} drops below V_{SO} , the control circuit switches power to the internal battery which preserves data. The internal button cell will maintain data in the M48Z35AY/V for an accumulated period of at least 10 years (at 25°C) when V_{CC} is less than V_{SO} .

As system power returns and V_{CC} rises above V_{SO} , the battery is disconnected, and the power supply is switched to external V_{CC} . Write protection continues until V_{CC} reaches $V_{PFD}(\text{min})$ plus $t_{REC}(\text{min})$. Normal RAM operation can resume t_{REC} after V_{CC} exceeds $V_{PFD}(\text{max})$.

Also, as V_{CC} rises, the battery voltage is checked. If the voltage is less than approximately 2.5V, an internal Battery Not OK (BOK) flag will be set. The BOK flag can be checked after power up. If the BOK flag is set, the first WRITE attempted will be blocked. The flag is automatically cleared after the first WRITE, and normal RAM operation resumes. Figure 11 illustrates how a BOK check routine could be structured.

 2. $V_{PFD}(\max)$ to $V_{PFD}(\min)$ fall time of less than t_F may result in deselection/write protection not occurring until $200\mu s$ after V_{CC} passes $V_{PFD}(\min)$.
 3. $V_{PFD}(\min)$ to V_{SS} fall time of less than t_{FB} may cause corruption of RAM data.
 4. $t_{REC}(\min) = 20ms$ for industrial temperature Grade (6) device.

 3. At $25^\circ C$, $V_{CC} = 0V$.

V_{CC} Noise And Negative Going Transients

I_{CC} transients, including those produced by output switching, can produce voltage fluctuations, resulting in spikes on the V_{CC} bus. These transients can be reduced if capacitors are used to store energy which stabilizes the V_{CC} bus. The energy stored in the bypass capacitors will be released as low going spikes are generated or energy will be absorbed when overshoots occur. A ceramic bypass capacitor value of 0.1μF (see Figure 13) is recommended in order to provide the needed filtering.

In addition to transients that are caused by normal SRAM operation, power cycling can generate negative voltage spikes on V_{CC} that drive it to values below V_{SS} by as much as one volt. These negative spikes can cause data corruption in the SRAM while in battery backup mode. To protect from these voltage spikes, ST recommends connecting a schottky diode from V_{CC} to V_{SS} (cathode connected to V_{CC}, anode to V_{SS}). (Schottky diode 1N5817 is recommended for through hole and MBRS120T3 is recommended for surface mount).
