

- All models feature the same compact dimensions to provide a uniform mounting pitch
- Built-in varistor effectively absorbs external surges
- Operation indicator (red LED) enables monitoring operation
- Protective cover for greater safety
- All models approved by UL/CSA; TUV approved models available
- Wide range of outputs: 5 to 40 A, up to 480 VAC/200 VDC
- Optional Y92B heat sinks allow relays to reach maximum rated loads
- 25-amp version ideal for many industrial control applications

**G3NA-220B**

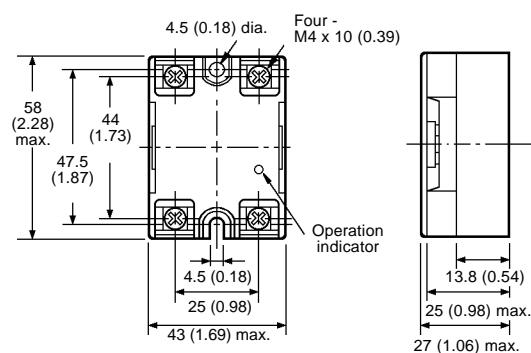

Note: The heat sink size refers to the combined area of the sides of the heat sink that radiate heat. For example, when a current of 18 A is allowed to flow through the SSR at 40°C, the graph shows that the heat sink size is about 450 cm<sup>2</sup>. Therefore, if the heat sink is square, one side of the heat sink must be 15 cm (15<sup>2</sup> x 2 = 450) or longer.

Note: 1. When used with the proper OMRON heat sink part number or an appropriately dimensioned equivalent.  
 2. The rated values approved by each of the safety standards (e.g., UL, CSA, and TUV) may be different from the performance characteristics individually defined in this catalog.  
 3. In the interest of product improvement, specifications are subject to change.

## Installation

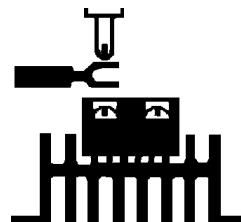

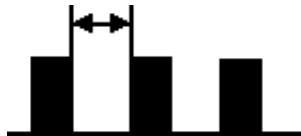

### Close Mounting

When mounting solid-state relays (SSRs) side by side, provide a space equivalent to the width of a single SSR between two adjacent SSRs. Otherwise, reduce the current flow to 1/2 to 1/3 of the rated current

### Heat Sink Mounting

To mount an SSR in a heat sink, first apply a heat conductive grease to the metal back surface of the SSR. Press the SSR firmly onto the heat sink to ensure a good seal. Screw the SSR down to the heat sink.

Next, wire the screw terminals and securely tighten the screws.

## Precautions

### ■ LOAD CONNECTION

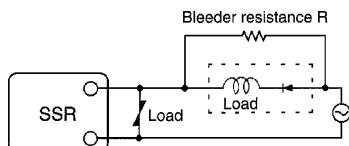

Before connecting a load that generates a high surge current, such as a lamp load, to the SSR, make sure that the SSR can withstand the surge current of the load.

OMRON's data sheet shows the non-repetitive peak value of the surge current that flows through the SSR. Normally, use 1/2 the non-repetitive peak surge current as the standard value. If a surge current exceeding that value is expected, connect a quick-blowing fuse to protect the SSR.

For an AC load, use a power supply rated at 50 or 60 Hz. The maximum operating frequency is 10 Hz. The G3NA has a built-in varistor for over-voltage protection.

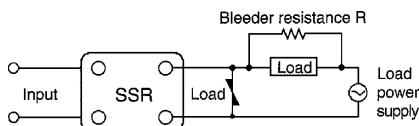

#### Half-wave rectifier loads

If the SSR is not provided with a zero cross function, a half-wave rectifier load can be switched with no problem. If the SSR is equipped with a zero cross function, allow about 20% of the load current to flow through the SSR.

Note: Connect bleeder resistor R.

#### Low-capacity loads

Note: Connect bleeder resistor R.

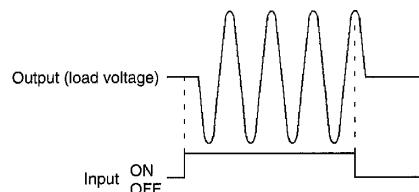

#### Capacitive loads

The supply voltage plus the charge voltage of the capacitor is applied to both ends of the SSR when it is OFF. Therefore, use an SSR model with an input voltage rating twice the size of the supply voltage.

Limit the charge current of the capacitor to less than half the peak surge current value allowed for the SSR.

### ■ ZERO CROSS FUNCTION

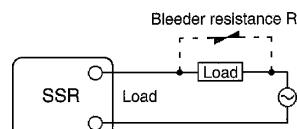

An SSR with a zero cross function operates when an AC load voltage reaches the zero point or its vicinity. This reduces clicking noises when the load is input, and minimizes the influence of an inductive load, such as a lamp, heater, or motor, on the power supply because the inrush current of the load is reduced. This can also minimize the scale of the surge current protection circuit.

### ■ LIFE EXPECTANCY (MTTF)

The mean time to failure (MTTF) for most SSRs is 100,000 hours. This, however, varies with the operating conditions. To ensure long life and stable operation of SSRs, plan for a constant operating environment, especially when the equipment incorporating SSRs is used under severe conditions such as high operating temperature, fluctuations in temperature, or continuous energizing.

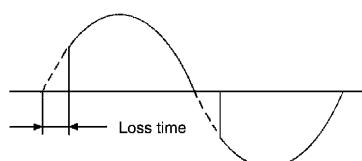

#### Varistor

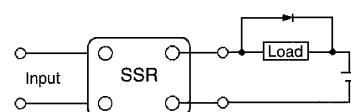

Use the following elements for surge absorption:

Operating voltage	Varistor voltage	Surge resistance
100 to 120 VAC	240 to 270 V	1,000 A min.
200 to 240 VAC	440 to 470 V	
380 to 480 VAC	820 to 1,000 V	

The applied voltage should be carefully determined before use, because the loss time for the output signal increases if the applied voltage and current are low.

For a DC or L load, a diode should be connected in parallel to the load to absorb the counter electromotive force of the load.
