

Quad SPDT Audio Switches

MAX4740/MAX4740H

General Description

The MAX4740/MAX4740H low on-resistance (0.61Ω typ) analog switches operate from a single 1.6V to 5.5V supply. The MAX4740/MAX4740H are quad, single-pole, double-throw (SPDT) switches and are configured to route audio signals. The MAX4740/MAX4740H are pin-to-pin compatible parts with the ST Microelectronics quad SPDT STG3699 analog switch.

The MAX4740 is a quad SPDT switch and the MAX4740H is a quad SPDT switch that can be placed in a high-impedance mode. Switching logic is controlled by 2 control bits (CB1 and CB2). The MAX4740/MAX4740H also feature a low on-resistance match (0.06Ω) and low power-supply current ($0.3\mu\text{A}$), which increases battery life.

The MAX4740/MAX4740H are available in a tiny 3mm x 3mm, 16-pin TQFN-EP, and 2.5mm x 2.5mm, 16-pin ultra-thin QFN packages.

Detailed Description

The MAX4740/MAX4740H quad SPDT audio switches are low on-resistance, low supply current, high power-supply rejection ratio (PSRR) devices that operate from a +1.6V to +5.5V single supply. The MAX4740/MAX4740H have two digital control inputs, CB1 and CB2, where each bit controls a pair of switches (see Tables 1 and 2).

Applications Information

The MAX4740/MAX4740H logic inputs accept up to +5.5V, regardless of supply voltage. For example with a +3.3V supply, CB1 and CB2 can be driven low to GND and high to +5.5V, allowing for mixed logic levels in a system. Driving CB1 and CB2 rail-to-rail minimizes power consumption. For a 3.3V supply voltage, the logic thresholds are +0.5V (low) and +1.6V (high).

Analog Signal Levels

Analog signals that range over the entire supply voltage range (V_{CC} to GND) can be passed with very little change in on-resistance (see the *Typical Operating Characteristics*). The switches are bidirectional, so the NO_, NC_, and COM_ terminals can be used as either inputs or outputs.

Power-Supply Sequencing and Overvoltage Protection

Caution: Do not exceed the Absolute Maximum Ratings since stresses beyond the listed ratings may cause permanent damage to the device.

Proper power-supply sequencing is recommended for all CMOS devices. Improper supply sequencing can force the switch into latch-up, causing it to draw excessive supply current. The only way out of latch-up is to

recycle the power and reapply properly. Connect all ground pins first, then apply power to V_{CC} , and finally apply signals to $NO_$, $NC_$, and $COM_$. Follow the reverse order upon power-down.
